1 General Information about DCF77

The radio remote clocks made by Meinberg receive the signal from the long wave transmitter DCF77. This long wave transmitter installed in Mainflingen near Frankfurt/Germany transmits the reference time of the Federal Republic of Germany. This time reference is either the Central European Time (Mitteleuropäische Zeit, MEZ) or the Central European Summer Time (Mitteleuropäische Sommerzeit, MESZ). The transmitter is controlled by the atomic clock plant at the Federal Physical Technical Institute (PTB) in Braunschweig/Germany and transmits the current time of day, date of month and day of week in coded second pulses. Once every minute the complete time information is available.

At the beginning of every second the amplitude of the high precision 77.5 kHz carrier frequency is lowered by 75% for a period of 0.1 or 0.2 sec. The length of these time marks represent a binary coding scheme using the short time mark for logical zeroes and the long time mark for logical ones. The information on the current date and time as well as some parity and status bits can be decoded from the time marks of the 15th up to the 58th second every minute. The absence of any time mark at the 59th second of a minute signals that a new minute will begin with the next time mark.

Our radio remote clocks decode the highly accurate information on date and time within a wide range around Germany. So some of our clocks are installed in Bilbao/Spain as well as in the City of Umeå in northern Sweden - fully satisfying the requirements of the users. The radio remote clocks automatically switch to summertime and back. The reception of the time information is free of charge and does not need to be registered.

Generally it is important to position the antenna in an optimal way. It should be mounted at least 30 centimeters away from the clock unit and from solid steel. The antenna should be aligned at a right angle to the direction of the transmitter (Frankfurt).

2 C600RS

The radio remote clocks C600RS has been designed for applications where only the serial interface is used to transmit information on date and time to other devices. The clock has an enhanced LF receiver and is manufactured using surface mounting technology (SMT). The electronic assembly is mounted in a plastic case with four LEDs in the front panel which let the user monitor the clock’s status.

2.1 Overview

2.1.1 Antenna and LF Receiver

An external ferrit antenna is used to receive the signal from DCF77. Optionally, a weather-proof antenna is available which can be mounted outdoor. A coaxial cable which can be up to more than 100 meters in length is used to pass the antenna’s output signal to the on-board LF receiver where it is demodulated by a detector with automatic gain control. The demodulated time marks are fed to the clock's microprocessor.

2.1.2 Microprocessor Circuit

Time marks from the receiver circuit are filtered and decoded by the microprocessor. If no errors are detected in the current time message an additional plausibility check against the previous time message is performed. If that plausibility check passes, too, the real time clock is read periodically and its date and time are passed to the serial port drivers. Additionally, the microprocessor generates output pulses when the second or minute changes. An on-board microprocessor supervisory circuit provides a watchdog timer which resets the microprocessor if the supply voltage drops below a specified threshold.

2.1.3 Buffered Real Time Clock

If the board’s power supply is turned off, a gold cap capacitor on the board lets the real time clock keep time and status for a minimum of 48 hours (typically 180 hours). This capacitor does not need any maintenance. Alternatively, the clock can be ordered with a lithium battery which has 10 years of life time guaranteed.

2.1.4 Asynchronour Serial Port

Two asynchronous serial ports can be used to transmit information on date and time to other devices. The port (COM 0) can be used as RS-232 port and (COM 1) as 20 mA current loop.
2.2 Installation

The radio remote clock has a built in AC power supply. After the power cable has been connected, a green LED labeled Netz indicates that the clock is ready to operate. If the antenna cable has been connected to both the antenna and the clock’s BNC connector, the brightness of the LED labeled Feldstärke reflects the signal strength of the 77.5 kHz carrier. In order to get the maximum signal, the antenna should be aligned in two steps. First it should be turned slowly until the Feld LED is mostly dimmed. Finally the antenna must be turned by 90° from this position to obtain maximum signal. The antenna should be installed at least 30 cm away from the clock from steel girders or plates.

If the antenna is installed properly and the signal from DCF77 can be received without strong distortions, the green LED labeled Modulation starts blinking exactly once per second, corresponding to the time marks from DCF77. If this LED flashes intermittently, there is some electrical noise around which prevents the microprocessor from decoding the time message. In this case, a better location for the antenna must be found.

After reset, the red LED labeled Freilauf indicates that the clock is running on xtal and has not synchronized with DCF77 yet. Due to the plausibility checks, it can take up to three minutes after power-up until the clock is synchronized and this LED is turned off. The state of this LED only changes when a new minute begins.

The serial interfaces are operational immediately after switching on. The type of data transfer, framing and baud rate can be adjusted by a monitor program.

2.2.1 Interfaces

Serial Ports

The asynchronous serial port can be configured by a DIL switch located inside the clock’s case. When the clock is being shipped, the levers of the DIL switch have been set to some defaults which are marked by asterisks in the tables below. If one of the switch settings has to be changed, the upper part of the clock’s case must be removed by dataching the 4 screws located at the edges of the cover.

Serial Input and Output Drivers

The serial string generated by the microprocessor is fed into a RS-232 output driver plus a 20mA current loop driver in parallel. If the clock is configured to send time messages automatically once per second or once per minute, both of the outputs may be used concurrently.

The serial input drivers need to be connected only if a serial string shall be sent on request. A Monitor program lets the user select either RS-232 input or current loop input. It is not possible to use both the current loop input and the RS-232 input together.

Both the current loop input and output can be wired for either active or passive operation. If a current loop driver shall be operated in active mode, either - 15V must be supplied at the connector or the corresponding pin of the port can be wired to ground. An example application at the end of this manual shows how to connect the port.
Transmission Speed

The transmission speed can be selected by the Monitor program. Any commonly used speed from 600 baud through 19200 baud can be configured.

Output mode

The serial port sends a time string on request by incoming ‘?’ character (ASCII code 3Fh). Additionally, a time string can be generated automatically either whenever a new second starts or when a new minute begins. A Monitor program are used to select the desired mode of operation:

Time Zone

A Monitor program lets the user select the clock's time zone. The serial string may either contain the Central European Time resp. Central European Summer Time (CET/CEST=MEZ/MESZ), or always UTC (formerly GMT).

Pulse Outputs

Whenever a new second or minute starts, a corresponding pulse (P_SEC, P_MIN) with a width of 200 msec is generated. These pulses are made available at the DB25 connector via optocoupler outputs. The P_SEC pulse
is also available with RS-232 level (-3...12V/+3...12V). If required, Jumper JP2 must be set to activate this pulse. See the technical description and application example at the end of this manual for details.
3 Technical Specifications C600RS

RECEIVER: Synchronous demodulator with automatic gain control
bandwidth: approx. 50Hz

ANTENNA: Active external ferrite antenna in a plastic case
Length of the cable: up to more than 100m

RF AMPLITUDE, MODULATION: Indicated by LED

TIMECODE CHECK: Parity and consistency checking over a period of two minutes
RF distortions indicated by both LED and a status character in
the serial output string
Without RF signal the clock runs on XTAL
with an accuracy of 10^-6

BATTERY BACKUP: Gold Cap or Lithium battery
when the power is turned off, the on-board RTC keeps the time
based on XTAL for more than 48 hours (gold cap) resp. more
than 10 years (lithium battery)

RELIABILITY OF OPERATION: Microprocessor supervisory circuit provides watchdog timer,
power supply monitoring and backup-battery switchover

OUTPUT PULSES: Optocoupler outputs (70V/20mA) provide pulses of 200msec
width whenever a new second resp. minute begins.
P_SEC pulse with RS232-level (Jumper JP2 must be set)

ASYNCHRONOUS SERIAL PORT: Transmission speed, framing, time zone and mode of operation
configurable by DIL switch

TRANSMISSION SPEED: 600 through 19200 baud

FRAMING: 7E1, 7E2, 8N1 or 8N2

MODE OF OPERATION: time string transmitted automatically once per second, once per
minute, or when a request character '?' has been received

TIME ZONE: MEZ/MESZ=CET/CEST, or UTC

OUTPUT STRING: see "Format of the Meinberg Standard Time String"

SERIAL LINE DRIVERS: Output: RS232 and 20mA current loop (active or passive)
Input: RS232 or 20mA current loop (active or passive)

CONNECTORS: DB25 connector
coaxial RF connector (BNC type)

POWER SUPPLY: 230V AC, 50Hz
-15V only when using 20mA current loop

PHYSICAL DIMENSIONS: Rolec Technobox TBA084
L x B x H (160mm x 81mm x 62mm)

AMBIENT TEMPERATURE: 0...50°C
HUMIDITY: max. 85%
OPTIONS: Hardware and software modifications according to customer specification

This device conforms to the directive 2004/108/EC on the approximation of the laws of the Member States of the European Community relating to electromagnetic compatibility.
3.1 Format of the Meinberg Standard Time String

The Meinberg Standard Time String is a sequence of 32 ASCII characters starting with the STX (start-of-text) character and ending with the ETX (end-of-text) character. The format is:

\[
\text{<STX>D:dd.mm.yy;w:mm.mm.ss;uvxy<ETX>}
\]

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

\[
\begin{align*}
\text{<STX>} & \quad \text{Start-Of-Text, ASCII Code 02h} \\
\text{dd.mm.yy} & \quad \text{sending with one bit accuracy at change of second} \\
\text{dd} & \quad \text{day of month (01..31)} \\
\text{mm} & \quad \text{month (01..12)} \\
\text{yy} & \quad \text{year of the century (00..99)} \\
\text{w} & \quad \text{the day of the week (1..7, 1 = Monday)} \\
\text{hh.mm.ss} & \quad \text{the current time (00..23)} \\
\text{hh} & \quad \text{hours (00..23)} \\
\text{mm} & \quad \text{minutes (00..59)} \\
\text{ss} & \quad \text{seconds (00..59, or 60 while leap second)} \\
\text{uv} & \quad \text{clock status characters (depending on clock type)}: \\
\text{u:} & \quad '\#' \quad \text{GPS: clock is running free (without exact synchr.)} \\
& \quad \text{PZF: time frame not synchronized} \\
& \quad \text{DCF77: clock has not synchronized after reset} \\
& \quad \text{(space, 20h)} \\
\text{v:} & \quad '\*' \quad \text{GPS: receiver has not checked its position} \\
& \quad \text{PZF/DCF77: clock currently runs on XTAL} \\
& \quad \text{(space, 20h)} \\
\text{x} & \quad \text{time zone indicator:} \\
& \quad 'U' \quad \text{UTC Universal Time Co-ordinated, formerly GMT} \\
& \quad \text{MEZ European Standard Time, daylight saving disabled} \\
& \quad 'S' \quad \text{MESZ European Summertime, daylight saving enabled} \\
\text{y} & \quad \text{announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:} \\
& \quad '\!' \quad \text{announcement of start or end of daylight saving time} \\
& \quad 'A' \quad \text{announcement of leap second insertion} \\
& \quad \text{(space, 20h) nothing announced} \\
\text{<ETX>} & \quad \text{End-Of-Text, ASCII Code 03h}
\end{align*}
\]
3.2 Format of the Uni Erlangen String (NTP)

The time string Uni Erlangen (NTP) of a GPS clock is a sequence of 66 ASCII characters starting with the STX (start-of-text) character and ending with the ETX (end-of-text) character. The format is:

```
<STX>tt.mm.jj; w: hh:mm:ss; v oo:o o; acdfg i;bbb.bbbbn lll.lllle hhhhm<ETX>
```

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **<STX>** Start-Of-Text, ASCII Code 02h
  - sending with one bit accuracy at change of second

- **dd.mm.yy** the current date:
  - *dd* day of month (01..31)
  - *mm* month (01..12)
  - *yy* year of the century (00..99)

- **w** the day of the week (1..7, 1 = Monday)

- **hh.mm.ss** the current time:
  - *hh* hours (00..23)
  - *mm* minutes (00..59)
  - *ss* seconds (00..59, or 60 while leap second)

- **v** sign of the offset of local timezone related to UTC

- **oo:oo** offset of local timezone related to UTC in hours and minutes

- **ac** clock status characters:
  - *a*: `#` clock has not synchronized after reset
  - ` ` (space, 20h) clock has synchronized after reset
  - *c*: `*` GPS receiver has not checked its position
  - ` ` (space, 20h) GPS receiver has determined its position

- **d** time zone indicator:
  - `S` MESZ European Summertime, daylight saving enabled
  - ` ` MEZ European Standard Time, daylight saving disabled

- **f** announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:
  - `!` announcement of start or end of daylight saving time
  - ` ` (space, 20h) nothing announced

- **g** announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:
  - `A` announcement of leap second insertion
  - ` ` (space, 20h) nothing announced

- **i** leap second insertion
  - `L` leap second is actually inserted
  - ` ` (active only in 60th sec.)
  - ` ` (space, 20h) no leap second is inserted

- **bbb.bbb** latitude of receiver position in degrees
  - leading signs are replaced by a space character (20h)

- **n** latitude, the following characters are possible:
‘N’ north of equator
‘S’ south of equator

longitude of receiver position in degrees
leading signs are replaced by a space character (20h)

longitude, the following characters are possible:
‘E’ east of Greenwich
‘W’ west of Greenwich

altitude above WGS84 ellipsoid in meters
leading signs are replaced by a space character (20h)

<ETX> End-Of-Text, ASCII Code 03h
3.3 Format of the ATIS Time String

The ATIS standard Time String is a sequence of 23 ASCII characters terminated by a CR (Carriage Return) character. The format is:

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **GID**: Address of the receiver code 7Fh
- **ABS**: Originator of message ASCII 'O' code 30h
- **TSQ**: Telegram number ASCII 'O' code 30h
- **CC**: Command code ASCII 'S' for SET code 53h
- **CS**: Command code ASCII 'A' for ALL code 41h
- **ST**: Time status ASCII 'C' for valid time code 43h

**yy.mm.dd.**
- **yy**: year of the century (00..99)
- **mm**: month (01..12)
- **dd**: day of month (01..31)

**hh.mm:ss.ff**
- **hh**: hours (00..23)
- **mm**: minutes (00..59)
- **ss**: seconds (00..59, oder 60 while leap second)

**w**
- **w**: the day of the week (1..7, 1=Monday)

**cc**
- **cc**: checksum in hex, built from all characters including GID,ABS,TSQ,CC,ST...

**<CR>**
- **<CR>**: Carriage Return, ASCII Code 0Dh

(The standard interface configuration for this string type is 2400 baud, 7E1)
3.4 Format of the SYSPLEX-1 Time String

The SYSPLEX1 time string is a sequence of 16 ASCII characters starting with the SOH (Start of Header) ASCII control character and ending with the LF (line feed, ASCII Code 0Ah) character. The format is:

\[ \text{\textless SOH\textgreater} \text{ddd:hh:mm:ssq} \text{\textless CR\textgreater}\text{\textless LF\textgreater} \]

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- `<SOH>` Start of Header (ASCII control character)
- Sending with one bit accuracy at change of second
- `ddd` day of year (001..366)
- `hh:mm:ss` the current time:
  - `hh` hours (00..23)
  - `mm` minutes (00..59)
  - `ss` seconds (00..59, or 60 while leap second)
- `q` Quality indicator
  - (space) Time Sync (GPS lock)
  - (?) no Time Sync (GPS fail)
- `<CR>` Carriage-return (ASCII code 0Dh)
- `<LF>` Line-Feed (ASCII code 0Ah)
3.5 Format of the SAT Time String

The SAT Time String is a sequence of 29 ASCII characters starting with the STX (start-of-text) character and ending with the ETX (end-of-text) character. The format is:

*<STX>* `dd.mm.yy/w/hh:mm:ssxxxxuv` *<ETX>*

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

*<STX>* Start-Of-Text, ASCII Code 02h

Sending with one bit accuracy at change of second

`dd.mm.yy` the current date:

- `dd` day of month (01..31)
- `mm` month (01..12)
- `yy` year of the century (00..99)

- `w` the day of the week (1..7, 1 = Monday)

`hh:mm:ss` the current time:

- `hh` hours (00..23)
- `mm` minutes (00..59)
- `ss` seconds (00..59, or 60 while leap second)

`xxxx` time zone indicator:

- `'UTC'` Universal Time Coordinated, formerly GMT
- `'MEZ'` European Standard Time, daylight saving disabled
- `'MESZ'` European Summertime, daylight saving enabled

`u` clock status characters:

- `'#'` clock has not synchronized after reset
- `' '` (space, 20h) clock has synchronized after reset

`v` announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:

- `'!'` announcement of start or end of daylight saving time
- `''` (space, 20h) nothing announced

*<CR>* Carriage Return, ASCII Code 0Dh

*<LF>* Line Feed, ASCII Code 0Ah

*<ETX>* End-Of-Text, ASCII Code 03h
3.6 Format of the Computime Time String

The Computime time string is a sequence of 24 ASCII characters starting with the T character and ending with the LF (line feed, ASCII Code 0Ah) character. The format is:

\[
T: \text{yy:mm:dd:ww:hh:mm:ss}<\text{CR}><\text{LF}>
\]

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **T** Start character
  - sending with one bit accuracy at change of second

- **yy:mm:dd** the current date:
  - \text{yy} year of the century (00..99)
  - \text{mm} month (01..12)
  - \text{dd} day of month (01..31)

- **ww** the day of the week (01..07, 01 = monday)

- **hh:mm:ss** the current time:
  - \text{hh} hours (00..23)
  - \text{mm} minutes (00..59)
  - \text{ss} seconds (00..59, or 60 while leap second)

- \text{<CR>} Carriage Return, ASCII Code 0Dh
- \text{<LF>} Line Feed, ASCII Code 0Ah
3.7 Format of the NMEA 0183 String (RMC)

The NMEA String is a sequence of 65 ASCII characters starting with the 'GPRMC' character and ending with the characters CR (carriage return) and LF (line-feed). The format is:

```
$GPRMC,hhmmss.ss,A,bbbb.bb,n,lllll.ll,e,0.0,0.0,ddmmmyy,0.0,a*hh<CR><LF>
```

The letters printed in italics are replaced by ASCII numbers or letters where as the other characters are part of the time string. The groups of characters as defined below:

- $ Start character, ASCII Code 24h
  - Sending with one bit accuracy at change of second
- hhmmss.ss the current time:
  - hh hours (00..23)
  - mm minutes (00..59)
  - ss seconds (00..59, or 60 while leap second)
  - ss fractions of seconds (1/10 : 1/100)
- A Status (A = time data valid)
  - (V = time data not valid)
- bbbbbb latitude of receiver position in degrees
  - Leading signs are replaced by a space character (20h)
- n latitude, the following characters are possible:
  - 'N' north of equator
  - 'S' south of equator
- lllllll longitude of receiver position in degrees
  - Leading signs are replaced by a space character (20h)
- e longitude, the following characters are possible:
  - 'E' east of Greenwich
  - 'W' west of Greenwich
- dddmmmyy the current date:
  - dd day of month (01..31)
  - mm month (01..12)
  - yy year of the century (00..99)
- a magnetic variation
- hh checksum (EXOR over all characters except 'S' and '*')
- <CR> Carriage Return, ASCII Code 0Dh
- <LF> Line Feed, ASCII Code 0Ah

3.10 Layout C600RS
3.11 Usage of the Current Loop Interfaces

The current loop interface can be wired to work in one of two modes: active output drives passive input, or passive output to active input.

3.11.1 Active Output to Passive Input

If the clock's current loop output shall be wired to operate as active output, a connection from the pin labeled +pass_out to Vcc(+5V) must be provided. The pin labeled -act_out is pulled down to the auxiliary -15V supply, which must be made available by the user.

If an external -15V supply is not available, the -act_out signal can be connected directly to GND, as shown below:
3.11.2 Passive Output to Active Input

If a current loop output shall be wired to operate as passive output, the input must be wired to operate as an active input. A connection from the pin labeled +pass_in to Vcc (+5V) must be provided. The pin labeled -act_in is pulled down to the auxiliary -15V supply, which must be made available by the user.

If an external -15V supply is not available, the -act_out signal can be connected directly to GND, as shown below:

4 Konformitätserklärung / Declaration of Conformity

Hersteller
Manufacturer
Meinberg Funkuhren GmbH & Co. KG
Lange Wand 9, D-31812 Bad Pyrmont

erklärt in alleiniger Verantwortung, dass das Produkt,
declares under its sole responsibility, that the product

auf das sich diese Erklärung bezieht, mit den folgenden Normen übereinstimmt
to which this declaration relates is in conformity with the following standards

EN 55022:2010, Class B
Limits and methods of measurement of radio interference characteristics of information technology equipment

EN 55024:2010
Limits and methods of measurement of Immunity characteristics of information technology equipment

EN 61000-3-2:2006
Electromagnetic Compatibility (EMC)
Limits for harmonic current emissions

EN 61000-3-3:2008
Electromagnetic Compatibility (EMC)
Limitation of voltage fluctuation and flicker in low-voltage supply systems

EN 60950-1:2006
Safety of information technology equipment
(+A11:2009)

2011/65/EU RoHS-directive

gemäß den Richtlinien 2004/108/EG (Elektromagnetische Verträglichkeit), 2006/95/EG (Niederspannungsrichtlinie) und 93/68/EWG (CE Kennzeichnung) sowie deren Ergänzungen.
following the provisions of the directives 2004/108/EC (electromagnetic compatibility), 2006/95/EC (low voltage directive) and 93/68/EEC (CE marking) and its amendments.
