2 Important Safety Information

2.1 Important Safety Instructions and Protective Measures

The following safety instructions must be respected in all operating and installation phases of the device. Non-observance of safety instructions, or rather special warnings and operating instructions in product manuals, violates safety standards, manufacturer instructions and proper usage of the device. Meinberg Funkuhren shall not be responsible for any damage arising due to non-observance of these regulations.

Depending on your device or the installed options some information is not valid for your device.

If a procedure is marked with the following signal words, you may only continue, if you have understood and fulfilled all requirements. In this documentation dangers and indications are classified and illustrated as follows:

![DANGER!]

The signal word indicates an imminently hazardous situation with a high risk level. This notice draws attention to an operating procedure or similar proceedings, of which a non-observance may result in serious personal injury or death.

![WARNING!]

The signal word indicates a hazard with a medium risk gradient. This notice draws attention to an operating procedure, a procedure or the like which, if not followed, can lead to serious injuries, possibly resulting in death.

![CAUTION!]

The signal word indicates a hazard with a low risk gradient. This notice draws attention to an operating procedure, a procedure or the like which, if not followed, can lead to minor injuries.

![ATTENTION!]

This notice draws attention to an operating procedure, a procedure or the like which, if not followed, can cause damage to the product or loss of important data.
### 2.2 Used Symbols

The following symbols and pictograms are used in this manual. To illustrate the source of danger, pictograms are used, which can occur in all hazard classes.

<table>
<thead>
<tr>
<th>Symbol</th>

Dieses Produkt fällt unter die B2B Kategorie. Zur Entsorgung muss es an den Hersteller übergeben werden. This product is handled as a B2B category product. In order to secure a WEEE compliant waste disposal it has to be returned to the manufacturer. |
The manuals for a product are included in the scope of delivery of the device on a USB stick. The manuals can also be obtained via the Internet. Enter www.meinbergglobal.com into your browser, then enter the corresponding device name in the search field at the top.

This manual contains important safety instructions for the installation and operation of the device. Please read this manual completely before using the unit.

This device may only be used for the purpose described in this manual. In particular, the given limits of the device must be observed. The safety of the installation in which the unit is integrated is the responsibility of the installer!

Non-observance of these instructions can lead to a reduction in the safety of this device!

Please keep this manual in a safe place.

This manual is intended exclusively for electricians or persons trained by a electrician who are familiar with the applicable national standards and safety rules. Installation, commissioning and operation of this device may only be carried out by qualified personnel.
2.3 Security during Installation

WARNING!

Preparing for Commissioning
This built-in unit, has been designed and examined according to the requirements of the standard IEC 60950-1 „Information Technology Equipment - Safety“.

When the built-in unit is used in a terminal (e.g., housing cabinet), additional requirements according to Standard IEC 60950-1 must be observed and complied with. In particular, the general requirements and the safety of electrical equipment (such as IEC, VDE, DIN, ANSI) as well as the applicable national standards are to be observed.

The device has been developed for use in the industrial sector as well as in residential areas and can only be used in such environments. For environments with higher levels of soiling, additional measures, e.g. Installation in an air-conditioned control cabinet required.

Transport, Unpacking, Installation
If the unit is brought into the operating room from a cold environment, condensation may occur, wait until the unit is temperature-controlled and absolutely dry before operating it.

When unpacking, setting up, and before operating the equipment, be sure to read the information on the hardware installation and the specifications of the equipment. These include, for example, dimensions, electrical characteristics, and necessary ambient and climatic conditions, etc.

The fire protection must be ensured in the installed state.

For mounting, the housing must not be damaged. No holes may be drilled in the housing.

For safety reasons, the device with the highest mass should be installed in the lowest position of the rack. Other devices must be placed from the bottom to the top.

The device must be protected against mechanical stress such as vibration or shock.
Connecting Data Cables

During a thunderstorm, data transmission lines must not be connected or disconnected (risk of lightning).

When wiring the devices, the cables must be connected or disconnected in the order of the arrangement described in the user documentation accompanying the device. Always attach all cables to the plug during connection and removal. Never pull the cable itself. Pulling the cable can cause the cables to disconnect from the plug.

Install the cables in a way that they do not constitute a hazard (danger of tripping) and are not damaged, i.e. kinked.

Connecting Power Supply

This equipment is operated at a hazardous voltage. Non-observance of the safety instructions in this manual may result in serious personal injury or property damage.

Before connecting to the power supply, a grounding cable must be connected to the earth connection of the device.

Before operation, check that all cables and lines work properly and are undamaged. Pay particular attention to the facts that the cables do not have kinks or that they are not too short around corners, and no objects are placed on the cables. Also make sure that all connections are secure.

Faulty shielding or cabling will endanger your health (electrical shock) and may destroy other equipment.

Ensure that all necessary safety precautions have been taken. Make all connections to a unit before turning on the power. Observe the safety instructions on the device (see safety symbols).

The metal housing of the device is grounded. It must be ensured that enough air and creepage distances to neighboring voltage-carrying parts are provided during assembly in the control cabinet and no short circuits are caused.

In the case of malfunctions or servicing (e.g. in the event of a damaged housing or power cable or when fluids or foreign objects enter), the current flow can be interrupted. Questions about the house installation, need to be clarified with your house administration.

The power supply should be connected with a short, low-inductance line.
### Important Safety Information

<table>
<thead>
<tr>
<th>AC Power Supply</th>
<th>DC Power Supply</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The device is a device of protection class 1 and may only be connected to a grounded outlet (TN system).</td>
<td>• Outside the assembly group the device must be disconnectable from the power supply in accordance with the provisions of IEC 60950-1 (e.g. by the primary line protection).</td>
</tr>
<tr>
<td>• For safe operation, the device must be protected by an installation fuse of max. 16 A and equipped with a residual current circuit breaker in accordance with the applicable national standards.</td>
<td>• Installation and disassembly of the power supply plug is only permitted if the assembly group is switched off (e.g. by the primary line protection).</td>
</tr>
<tr>
<td>• The unit must always be disconnected from the mains and not from the appliance.</td>
<td>• The supply lines must be adequately secured and dimensioned.</td>
</tr>
</tbody>
</table>
| • Devices with mains plugs are equipped with a safety-tested mains cable of the country of use and may only be connected to a grounded shockproof socket, otherwise electric shock may occur. | **Connection Cross Section:**
| • Make sure that the mains socket on the appliance or the mains socket of the house installation is freely accessible to the user so that the mains cable can be pulled out of the socket in case of emergency. | 1 mm² – 2.5 mm²
   | | 17 AWG – 13 AWG |
| • The device must be supplied with a suitable disconnector (switch). The separation device must be easily accessible, placed near the device and marked as a separation device for the unit. | |
2.4 Protective Conductor- / Ground-Terminal

**ATTENTION!**

In order to ensure safe operation and to meet the requirements of IEC 62368-1, the device must be correctly connected to the protective earth conductor via the protective earth connection terminal.

If an external earth connection is provided on the housing, it must be connected to the equipotential bonding rail (grounding rail). The mounting parts (without cable) are not included in the scope of delivery.

**Note:**
Please use a grounding cable $\geq 1.5 \text{ mm}^2$
Always pay attention to a correct crimp connection!
2.5 Safety during Operation

WARNING!

Avoiding Short-Circuits
Make sure not to get any objects or liquids inside the unit. Electric shock or short circuit could result.

Ventilation Slots
Make sure that the ventilation slots are not covered or dusty, as there is a danger of overheating during operation. Disturbances during operation can result.

Normal Operation
The normal operation and the observance of the EMC limits (electromagnetic compatibility) are only ensured if the housing cover is properly installed and when the doors are closed (cooling, fire protection, shielding against electrical, magnetic and electromagnetic fields).

Switch off in fault / service case
By switching off, the devices are not disconnected from the power supply. In the event of a fault or service case, the devices must be immediately disconnected from all power supplies.

Follow the steps below:
- Switch off the device
- Disconnect all power plugs
- Inform the service
- Devices that are connected via one or more uninterruptible power supplies (UPS) remain operational even when the UPS power cord is disconnected. Therefore, you must put the UPS out of operation according to the documentation of the corresponding user documentation.
2.6 Safety during Maintenance

**WARNING!**

When you are expanding the device, use only device parts that are approved for the system. Non-observance may result in injury to the EMC or safety standards and cause malfunction of the device.

If device parts, which are released for the system, are extended or removed there may be a risk of injury in the area of the hands, due to the pull-out forces (approx. 60 N).

The service informs you which device parts may be installed.

The device must not be opened, repairs to the device may only be carried out by the manufacturer or by authorized personnel. Improper repairs can result in considerable danger to the user (electric shock, fire hazard).

Unauthorized opening of the device or of individual parts of the device can also lead to considerable risks for the user and result in a loss of warranty as well as an exclusion of liability.

- Danger due to moving parts – keep away from moving parts.

- Device parts can become very hot during operation. Do not touch these surfaces! If necessary, switch off the unit before installing or removing any equipment, and allow it to cool down.

2.7 Handling Batteries

**CAUTION!**

The lithium battery on the receiver modules has a service life of at least 10 years. If an exchange is necessary, the following notes must be observed:

The device is equipped with a lithium battery. The battery must not be short-circuited or recharged. Replacement of the lithium battery may only be carried out by the manufacturer or authorized personnel.

Risk of explosion if the battery is not replaced correctly. Replace only with the same or equivalent type recommended by the manufacturer.

When disposing used batteries, observe the local regulations for the disposal of hazardous waste.
2.8 Cleaning and Care

ATTENTION!

Do not wet clean the appliance! Penetrating water can cause considerable dangers to the user (e.g., electric shock).

Liquid can destroy the electronics of the device! Liquid penetrates into the housing of the device and can cause a short circuit of the electronics.

Only clean with a soft, dry cloth. Never use solvents or cleaners.

2.9 Prevention of ESD Damage

ATTENTION!

The designation ESD (Electrostatic Sensitive Devices) refers to measures which are used to protect electrostatically endangered components from electrostatic discharge and thus to prevent destruction. Systems and assemblies with electrostatically endangered components usually have the following characteristics:

Indicator for assemblies with electrostatic endangered components

The following measures protect electrostatically endangered components from destruction:

Prepare removal and installation of assemblies
Unload yourself (for example, by touching a grounded object) before touching assemblies.

Ensure that you wear a grounding strap on the wrist when working with such assemblies, which you attach to an unpainted, non-conductive metal part of the system.

Use only tools and devices that are free from static electricity.

Transporting Assemblies
Assemblies may only be touched at the edge. Do not touch any pins or conductors on assemblies.

Installing and Removing Assemblies
Do not touch persons who are not grounded while removing or installing components. This could result in a loss of grounding protection from your electrostatic discharge.

Storing Assemblies
Always keep assemblies in ESD protective covers. These protective covers must be undamaged. ESD protective covers, which are extremely wrinkled or even have holes, no longer protect against electrostatic discharge.

ESD protective covers must not be low-resistance and metallically conductive if a lithium battery is installed on the assembly.
2.10 Return of Electrical and Electronic Equipment

ATTENTION!

WEEE Directive on Waste Electrical and Electronic Equipment 2012/19 / EU
(WEEE Waste Electrical and Electronic Equipment)

Separate Collection
Product Category: According to the device types listed in the WEEE Directive, Appendix 1, this product is classified as an IT and communication device.

This product meets the labeling requirements of the WEEE Directive. The product symbol on the left indicates that this electronic product must not be disposed of in domestic waste.

Return and Collection Systems
For returning your old equipment, please use the country-specific return and collection systems available to you or contact Meinberg.

The withdrawal may be refused in the case of waste equipment which presents a risk to human health or safety due to contamination during use.

Return of used Batteries
Batteries marked with one of the following symbols may not be disposed of together with the household waste according to the EU Directive.
3 Before you start

3.1 Text and Syntax Conventions

This chapter briefly describes the text and syntax conventions used in this manual.

**Web Interface:** example "Menu Network"
Submenu "Network → Network Interfaces"
Items in Submenu "Network → Network Interfaces → IPv4"

The menu navigation is logically separated by an right arrow (→).

**Directory names / Paths** Example: Lantime configuration file
The directory names and paths are displayed in italics.

**Code and CLI Commands**

```
- cmd/www-upload.htm
#Program code and CLI commands are displayed in a grey box with monospace font.
```

**User passwords:**
The following characters are currently allowed for user passwords and shared secret:

Allowed character set for both:

```
validchars[] = abcdefghijklmnopqrstuvwxyz
ABCDEFGHIJKLMNOPQRSTUVWXYZ
0123456789
=-_.:#*?@/+!
```

4 Introduction

A LANTIME is a multi-purpose time and frequency synchronization solution with a flexible approach to support a large number of synchronization requirements in different applications and network environments. The system combines a powerful CPU with dedicated hardware like reference clocks or I/O modules, creating a powerful network appliance that supports almost all commonly used time and frequency synchronization protocols and signals.

The basic installation of a LANTIME Server is a very easy and straightforward process. After installing the hardware, the network address, the netmask and the default gateway have to be configured to be able to access the web GUI. If everything is set up correctly as soon as the device is reachable over the network, it can start serving time via NTP and/or PTP.

In addition to the time sync protocols NTP and PTP, the LANTIME system supports a number of additional network protocols primarily used for remote management of the system: HTTP(S), FTP, SSH and Telnet. Remote configuration, status checks and other maintenance procedures like firmware updates or configuration backups can be controlled from any WEB browser. For security reasons, every protocol can be enabled or disabled for each configured IP address, allowing to reduce potential attack vectors and effectively control access to the device.

Status changes, alarms or other important events are logged in local log files and additionally can be forwarded to external SYSLOG servers. A number of notification protocols are supported to integrate the LANTIME system into already existing IT monitoring solutions. For example, SNMP traps or automatically generated e-mails are two potential options for notifying IT administrators about important events.

Installing multiple LANTIME devices in one network is a way to create redundancy for important network time synchronization services.
4.1 Network Configuration Concept

The LANTIME system supports a wide range of different network environments due to its flexible and powerful network configuration concept. A separation between physical and logical ("virtual") interface configurations covers almost all possible requirements for datacenters, telecommunication backhaul networks and industrial network environments.

Each LANTIME server has at least one physical ethernet interface which is provided by the CPU module (lan0). Additional network interfaces can be provided by network expansion cards (LNE or TSU cards) or on backplanes (depending on model). These additional physical interfaces can be used to provide synchronization services to multiple physical network segments, to separate management and synchronization networks or to combine multiple ethernet interfaces to form redundant connections ("bonding"). The 7th generation of LANTIME firmware (LTOS7) can manage up to 99 physical network interfaces as a theoretical maximum.

Configuration of IPv4 and IPv6 addresses is done based on logical interface configurations. Each logical interface is assigned to one physical ethernet port and can be configured to use one IEEE 802.1q VLAN ID. The current firmware version supports up to 99 logical interfaces per server and all of those could be theoretically assigned to a single physical port.

The network ports of TSU modules (for PTP and Hardware-NTP) are not providing this logical interface functionality and are limited, at least in the current firmware version, to one IPv4/IPv6 address and one VLAN ID per physical interface. Redundancy and connectivity to multiple network segments and VLANs can be achieved by adding multiple TSU cards in a system.

For each logical interface the available network services for synchronization (NTP, TIME, ...) and management (HTTP, HTTPS, SSH, SNMP, TELNET, ...) can be enabled/disabled individually. This allows to only provide synchronization on one IP address and remote access the unit for management tasks over a different IP address.

4.2 Additional Features

- external NTP timeserver
- free configuration of NTP: thereby MD5 authentication and access control via address & mask restriction
- extended menu guidance for configuration and monitoring via Telnet, SSH or serial terminal interface
- optional up to 3 RJ45/10/100 MBit Ethernet interfaces
- extended HTTP statistic support with long-term graphic and access statistic to NTP
- alarm messages can be displayed on external large display VP100/20/NET
- USB memory stick slot for extended functionality: software update, transfer of secure certificates, log files and configurations, keypad locking

4.3 User Interface

- Terminal connection via serial interface, status LED
- Web browser interface with graphical statistic of the one-day cycle offsets
- Telnet or Secure Shell Login for password protected operation of the Linux operating system
- FTP access for updating the operating system and downloading log files
- Simple Network Management Protocol for automatically SNMP-Traps in case of alarm
- SYSLOG messages can be passed to different computers
- Configurable e-mail notification
- Simulation of a synchronous radio clock in order to operate without antenna
4.4 Input and Output Options

- Additional Ethernet RJ45 connectors available (eight in 3U housing, four in 1U housing and eight additional connectors in HS - XL railmount housing)
- Frequency and pulse outputs via BNC connectors (e.g. 10 MHz, 2048 MHz, PPS)
- Higher free running accuracy with optional oscillators (OCXO)
- IRIG-B outputs
- ANZ14NET or VP100/20/NET as display connected via network

Additional Ethernet RJ45 connectors available:

4.5 Network Time Protocol (NTP)

NTP is a common method for the synchronization of hardware clocks in local and global networks. The basic concept, version 1 [Mills88], was published in 1988 as RFC (Request For Comments). Experiences acquired from its practical use on the Internet was followed by version 2 [Mills89]. The NTP software package is an implementation of the actual version 3 [Mills90], based on the specification RFC-1305 from 1990 (directory doc/NOTES). Permission to use, copy, modify and distribute this software for any purpose and without fee is hereby granted (read File COPYRIGHT).

NTP operates in a way that is basically different from that of most other timing protocols. NTP does not synchronize all connected clocks; instead it forms a hierarchy of timeservers and clients. Each level in this hierarchy is called a stratum, and Stratum 1 is the highest level. Timeservers at this level synchronize themselves by means of a reference time source such as a radio controlled clock, satellite receiver or modem time distribution. Stratum 1 Servers distribute their time to several clients in the network which are called Stratum 2.

Highly precise synchronization is feasible because of the several time references. Every computer synchronizes itself with up to three valued time sources. NTP enables the comparison of the hardware times and the adjustment of the internal clock. A time precision of 128 ms, and often better than 1 ms, is possible.

4.5.1 NTP Clients

The NTP software package was tested on different UNIX systems. Almost all UNIX-like systems come with a pre-installed NTP client software. In order to use the LANTIME as an NTP server, it is required to add its IP address to the client configuration. NTP client software are available for most other operating systems like Microsoft Windows or MAC OS.

The following WEB site is recommended to get the latest version of NTP:
http://www.ntp.org

You can find more information on our web page at: https://www.meinbergglobal.com/english/sw/ntp.htm
4.6 Option: Precision Time Protocol (PTP) / IEEE 1588

Precision Time Protocol (PTP or IEEE 1588) is a time synchronization protocol that offers sub-microsecond accuracy over a standard Ethernet connection. This accuracy can be achieved by adding a hardware timestamping unit to the network ports that are used for PTP time synchronization. The timestamping unit captures the exact time when a PTP synchronization packet is sent or received. These timestamps are then taken into account to compensate for transfer delays introduced by the Ethernet network.

In PTP networks there is only one recognized active source of time, referred to as the Grandmaster Clock. If two or more Grandmaster Clocks exist in a single network, an algorithm defined in the PTP standard is used to determine which one is the „best” source of time. This „Best Master Clock” algorithm must be implemented on every PTP/IEEE1588 compliant system to insure that all clients („Slave Clocks”) will select the same Grandmaster. The remaining deselected Grandmaster Clocks will „step back” and enter a passive mode, meaning that they do not send synchronization packets as long as that is being done by the designated Grandmaster.

The existing network infrastructure components play a big role in a PTP network and directly influence the level of accuracy that can be achieved by the clients. Asymmetric network connections degrade the accuracy, therefore classic layer 2 and 3 Ethernet switches with their „store and forward” technology are not suitable for PTP networks and should be avoided. With activating the HQ-Filter (see chapter HQ-Filter) the Jitter can be eliminated. Simple Ethernet hubs with fixed pass-through times are not a problem. In large networks, special switches with built-in PTP functionality help to maintain high accuracy even over several subnets and longer distances. These components act as „Boundary Clocks” (BC) or „Transparent Clocks” (TC). They compensate their internal packet processing times by using timestamping units on each port. When acting as a Boundary Clock, they synchronize to the Grandmaster clock, and in turn act as a Master to the other subnets they are connected to. When acting as a Transparent Clock, then the „residence time” of the Masters´ Sync-Packet is measured and added to the packet as a correction value. Internally the PTP timescale TAI (see chapter Timescale in Global Parameters).
4.6.1 General Information

The internal PTP card acts as a network interface card (10/100MBit) with an integrated hardware time stamp unit to obtain time stamps in PTP compatible networks. In conjunction with a single board computer running the PTP protocol stack and a reference time source (PTP master only) the module is capable of building a PTP Master or Slave system:

The Time Stamp Unit, integrated in an FPGA (Field Programmable Gate Array, a programmable logic device), checks the data traffic on the MII-interface between the PHY receiver (physical connection to the network) and the Ethernet controller (MAC) on the PTP module. If a valid PTP packet is detected, the time stamp unit takes a time stamp of that packet which is read by a single board computer (SBC) running the PTP software. The configuration and status traffic between the PTP board and main SBC is done over a USB connection.
4.6.2 Functionality in Master Systems

After power up, the module accepts the absolute time information (PTP seconds) of a reference time source (e.g. GPS reference clock) only once, and the PTP nanoseconds are set to zero. If the oscillator frequency of the reference time source has reached its nominal value, the nanoseconds are reset again. This procedure leads to a maximum deviation of 20 nsec of the pulse per second (1PPS) of the PTP Master compared to the 1PPS of the GPS reference clock. The reference clock of the PTP board’s time stamp unit (50 MHz) is derived from the GPS disciplined oscillator of the reference time source using a PLL (Phase Locked Loop) of the FPGA. This achieves a direct coupling of the time stamp unit to the GPS system.
4.6.3 Functionality in Slave Systems

After decoding valid time information from a PTP Master, the system sets its own PTP seconds and nanoseconds accordingly. The PTP offset calculated by the PTP driver software of the single board computer is used to adjust the master oscillator of the TSU-USB. This allows the PTP Slave to generate very high accuracy output signals (10 MHz/1PPS/IRIG).
4.6.4 PTPv2 IEEE 1588-2008 Configuration Guide

Setting up all devices in a PTP synchronization infrastructure is one of the most important parts in a network time synchronization project. The settings of the involved Grandmaster clocks as the source of time and the end devices ("Slaves") have to match in order to allow them to synchronize and avoid problems later, when the PTP infrastructure is deployed to production environments. In addition to that, the use of PTP aware network infrastructure components, namely network switches, introduces another set of parameters that have to be harmonized with the masters and slaves in a PTP setup.

It is therefore very important to start with making decisions how the to-be-installed PTP synchronization solution should operate, e.g. should the communication between the devices be based on multicast or unicast network traffic or how often should the masters send SYNC messages to the slaves.

This chapter lists the most important options and their implications on a synchronization environment in general. A detailed explanation of the configuration settings within the LANTIME configuration interfaces can be found later within this documentation.

4.6.4.1 General Options

The following general mode options have to be decided before deploying the infrastructure:

1) Layer 2 (Ethernet) or Layer 3 (UDP/IPv4) connections
2) Multicast or Unicast
3) Two-Step or One-Step Operation
4) End-to-End or Peer-to-Peer Delay Mechanism

The above options need to be defined for the whole setup, if devices do not stick to the same settings, they will not be able to establish a working synchronization link.

4.6.4.2 Network Layer 2 or Layer 3

PTP/IEEE 1588-2008 offers a number of so-called mappings on different network communication layers. For Meinberg products you can choose between running PTP over IEEE 802.3 Ethernet connections (network Layer 2) or UDP/IPv4 connections (Layer 3).

Layer 3 is the recommended mode, because it works in most environments. For Layer 2 mode the network needs to be able to provide Ethernet connections between master and slave devices, which is often not the case when your network is divided into different network segments and you have no layer 2 routing capabilities in your network infrastructure.

The only benefit of using Layer 2 mode would be a reduced traffic load, because the transmitted network frames do not need to include the IP and UDP header, saving 28 bytes per PTP packet/frame. Due to the fact that PTP is a low traffic protocol (when compared to other protocols), the reduced bandwidth consumption only plays a role when low-bandwidth network links (e.g. 2Mbit/s) have to be used or in pay-per-traffic scenarios, for example over leased-line connections.
4.6.4.3 Multicast or Unicast

The initial version of PTP (IEEE 1588-2002 also known as PTPv1) was a multicast-only protocol. Multicast mode has the great advantage that the master clock needs to send only one SYNC packet to a Multicast address and it is received by all slave devices that listen to that multicast address.

In version 2 of the protocol (IEEE 1588-2008) the unicast mode was introduced in addition to the multicast mode. In unicast mode, the master has to send one packet each to every slave device, requiring much more CPU performance on the master and producing orders of magnitudes more traffic.

On the other hand, some switches might block multicast traffic, so that in certain environments, Unicast mode has to be used.

4.6.4.4 Two-Step or One-Step

The PTP protocol requires the master to periodically send SYNC messages to the slave devices. The hardware time stamping approach of PTP requires that the master records the exact time when such a SYNC packet is going on the network wire and needs to communicate this time stamp to the slaves. This can be achieved by either sending this time stamp in a separate packet (a so-called FOLLOW-UP message) or by directly manipulating the outgoing SYNC message, writing the hardware time stamp directly into the packet just before it leaves the network port.
4.6.4.5 End-To-End (E2E) or Peer-To-Peer (P2P) Delay Measurements

In addition to receiving the SYNC/FOLLOWUP messages a PTP slave device needs to be able to measure the network delay, i.e. the time it took the SYNC message to traverse the network path between the master and the slave. This delay is required to correct the received time information accordingly and it is measured by the slave in a configured interval (more about the message intervals later). A delay measurement is performed by sending a so-called DELAY_REQUEST to the master which timestamps it and returns the timestamp in a DELAY_RESPONSE message.

IEEE 1588-2008 offers two different mechanisms for performing the delay measurements. A slave can either measure the delay all the way to the master, this is called End-To-End (or E2E in short) or to its direct network neighbors (which would in almost all cases be a switch – or two in a redundant setup), using the Peer-To-Peer delay measurement mechanism (P2P). The delay measurements of all links between the master and the slave are then added and accumulated while a SYNC packet is traversing the network.

The advantage of this method is that it can dramatically reduce the degradation of accuracy after topology changes. For example: in a redundant network ring topology the network delay will be affected when the ring breaks open and network traffic needs to be redirected and flows into the other direction. A PTP slave in a sync infrastructure using E2E would in this case apply the wrong delay correction calculations until it performs the next delay measurement (and finds out that the network path delay has changed). The same scenario in a P2P setup would see much less time error, because the delay of all changed network links were already available.

The drawback: the P2P approach requires that all involved PTP devices and all switches support this mechanism. A switch/hub without P2P support would in the best case simply pass the so-called PDELAY messages through and as a result degrade the accuracy of the delay measurements. In the worst case it would block/drop the PDELAY messages completely, which effectively would result in no delay measurements at all.

So, E2E is the only available choice if you are running PTP traffic through non-PTP-aware switches. It is a reasonable choice if you are not using redundant network topologies or can accept that the delay measurements are wrong for a certain amount of time.
4.6.4.6 Message Rate Settings

The decision between the different general mode options is mainly dictated on the network environment in which the PTP infrastructure is installed. In addition to the mode selection, a number of intervals for certain types of PTP network messages needs to be defined. In most cases, the default values as defined in the standard are a safe bet, but there are applications and scenarios where a custom message rate is required.

A possible example is a situation where the PTP infrastructure is integrated within an environment with high network load. In this case, the PTP packets can be affected by the effect of packet delay variation (PDV). An increase of the PTP message rate(s) can avoid synchronization problems due to packet queuing within non-PTP compliant switches which might cause false measurements. At higher rates, these false measurements can be detected and corrected faster as compared to lower rates at the cost of increased traffic.

The message rates for the following message types can be changed:

1) ANNOUNCE messages
2) SYNC/FOLLOWUP messages
3) (P)DELAY_REQUEST messages

4.6.4.7 ANNOUNCE Messages

These PTP messages are used to inform the PTP network participants about existing and available master clock devices. They include a number of values that indicate the potential synchronization accuracy.

The procedure used to decide which of the available devices (that could become masters) is selected is called the "best master clock algorithm" (BMCA). The values that are used in this BMCA are read from the ANNOUNCE messages that potential masters send out periodically.

The rate at which these messages are sent out are directly affecting the time that is required by a slave device to select a master and to switch to a different master in case the selected one fails.

Multiple devices can simultaneously transmit ANNOUNCE messages during periods in which no master has been selected (yet). This happens for example when a PTP network is powered up, i.e. all devices are starting to work at the same time. In this case all devices that consider themselves (based on their configuration and status) being capable of providing synchronization to all the other PTP devices will start to send out ANNOUNCE messages. They will receive the other candidates’ ANNOUNCE messages as well and perform the BMCA. If they determine that another candidate is more suitable to become the master clock, they stop sending ANNOUNCE messages and either become slave devices or go into "PASSIVE" mode, waiting for the selected master to stop sending ANNOUNCE messages. This is determined to be the case when no ANNOUNCE message is received within 3 ANNOUNCE message intervals.

As an example, if the ANNOUNCE interval has been configured to be 2 seconds (one message every 2 seconds, the default value), the master is considered to have failed when no message has been received for 6 seconds.

In order to choose a master (a backup master clock or the primary one during initialization) the devices require to receive at least two consecutive ANNOUNCE messages. Continuing our example, it would take the 6 seconds to determine that the current master has failed and another 4 seconds to select the new one. That means an ANNOUNCE interval of 2 seconds translates into at least 10 seconds of "switching time" and 4 seconds of "initial master clock selection time". So, choosing a shorter ANNOUNCE message interval will allow a faster switching to a backup master clock, but it can lead to false positives when the chosen interval is too short for the network environment.
4.6.4.8 SYNC/FOLLOWUP Messages

The selected master clock sends out SYNC (and, in Two-Step environments, the corresponding FOLLOWUP) messages in a configured interval. This interval (default value is one SYNC/FOLLOWUP packet every second) determines how often the slave devices receive synchronization data that allows them to adjust their internal clocks in order to follow the master clock time. Between receiving two SYNC messages, a slave clock runs free with the stability determined by its own internal time base, for example a crystal oscillator. One important factor for deciding on the SYNC interval is the stability of this oscillator. A very good oscillator requires a lower SYNC message rate than a cheaper, low-accuracy model. On the other hand you directly affect the required network bandwidth by changing the SYNC interval.

For Meinberg slave devices, the default one-SYNC-every-second setting is more than enough to achieve the highest possible synchronization accuracy.

4.6.4.9 (P)DELAY_REQUEST Messages

As explained in the General Mode Options chapter (see the "End-To-End or Peer-to-Peer" section), the delay measurements are an important factor for achieving the required accuracy. Especially in E2E mode, the network path delay measurements play a crucial part in the synchronization process. Per default, the slaves will perform delay measurements every 8 seconds, resulting in sending and receiving one packet. This can be increased in case the network path delay variation in the network is relatively large (i.e. the time it takes for the SYNC message to reach the slave varies a lot) or the slave devices have to tightly follow the master and adjust their time base (oscillator) very often due to its instability.

Meinberg slave devices will limit the effect of an outdated path delay measurement by using filters and optimized PLL algorithms. This avoids that a clock "jumps around" and basically monitors the time difference to the master clock carefully for a certain amount of time before adjusting its own clock. With a low cost time base this is not possible, because the instability (i.e. temperature-dependent drift and overall short term stability/aging effects) and therefore these slaves would require to perform as many delay measurements and receive as many SYNC/FOLLOWUP messages as possible.

For P2P mode the delay request interval is not as critical, simply because the delay variation on a single-hop link (i.e. from your slave device to its switch) is very stable and does not change dramatically in typical environments.

Current firmware versions of Meinberg Grandmaster clocks (V5.32a and older) do not offer changing the Delay message rate in Multicast mode, it is fixed to one delay request every 8 seconds. Since this is actually a value that is transmitted in the DELAY_RESPONSE message as a maximum value, the slave devices are not allowed to perform delay measurements more often.
4.6.4.10 HQ Filter

If you use non PTP aware switches in a network where PTP should be used then the timing accuracy of the offset depends on the characteristic of the switches. Non PTP switches will cause time jitters (due to non deterministic delays in each path direction) in PTP measurement. In this section, the term "jitter" is used to describe the maximum deviation of the measured offsets around a certain mean value. This time jitter of standard non-PTP compliant switches can be in the range of 100 ns up to 10000 ns. When using routers this jitter can be even higher. To reduce this time jitter the HQ filter can be activated to achieve a better PTP slave synchronization quality. With Layer2 switches the accuracy can be achieved in the range of submicro seconds. Also Jitter caused by high network load and faulty measurements will be eliminated.

Functionality

After activating the HQ-Filter some PTP measurements will be done first without controlling the timing of the PTP slave. This phase will be indicated by an extra hint "init" in the current status of the PTP slave. During this phase the maximum jitter of the PTP offset, the path delay and the current drift of the internal oscillator will be calculated by statistical methods. The only filter parameter which can be set by the user is the estimated accuracy which will set the maximum expected range of the incoming time jitter. All input values that are out of this range will be dropped. The maximum jitter of the input will be updated continuously during normal operation. By default estimated accuracy will be set to 1s to determine the maximum jitter automatically.

PDSC

PDSC means "Path Delay Step Compensation". The PDSC feature tries to eliminate jumps of the PTP path delay, so that there will be no effect on the timing accuracy. Such a jump of the PTP path delay (which should be usually constant) will be caused by changing the topology of the PTP network which could happen in SDH networks for example. The change of the PTP path delay is only detected, if the step is larger than the measured time jitter. This feature is an extension of the HQ-Filter and therefore the HQ-Filter has to be activated.
5 Unboxing

After unpacking the LANTIME time server, please check the contents for completeness – regarding to the included packing list.

A LANTIME Package Contents

1. Assembly brackets for 19 Inch rack mounting (optional for LANTIME M200)
2. Protection spacer (M200 / M300 / M600)
3. Screws for brackets (M200 / M300 / M600)
4. 3-pin DFK connector or 5-pin DFK connector (additional connector in case of AC/DC or DC power supply)
5. USB stick with software and documentation
6. Power cord (only in case of AC power supply)
7. Option: power cable with 5-pin connector

Only with delivered Antenna

8. Antenna
9. Optional: cable for surge voltage protector
10. Antenna cable
11. Optional: surge voltage protector with bracket
12. Brackets for pole or wall mounting
13. Pole for antenna mounting (GPS Antenna)
B  Mounting Kit for GPS Antenna
   (wall or pole mounting)

C  Mounting Kit for Long Wave Antenna
   (wall mounting)

Note: Please read the safety instructions and the manual carefully to familiarize yourself with the safe and proper handling of electronic devices. The product documentation can be found on the USB Flash Memory.
6 LANTIME Installation

- Connecting the LANTIME
- Entering the IP Address
- Connecting the Antenna
- Configuration via the Web Interface

Connecting the LANTIME

Make sure that the power switch (if available) is in the '0' position (off), and plug the power cord into the power socket of your LANTIME. Then connect the device to your computer network using a suitable network cable. After switching on power, the following message is displayed:

MEINBERG LANTIME
is booting ...
please wait ...
......

After running a number of power-on self tests, the time server is in operation mode and the main screen appears.
Entering the IP Address
Initial installation requires setting up an IP address, netmask and (in most network environments) a default gateway. To get an overview of the current configuration, press F2. Press F2 again to enter the Network SETUP screen:

Navigate to "Interfaces" using the arrow keys and press OK to change to the configuration menu of the connected network interface. You can select the network port with the "Down" and "Up" arrow keys (↓ | ↑).

**Entering the IP Address manually (not using DHCP)**
Deactivate DHCP and set up a valid IP address, netmask and (if required) a default gateway. This can be done by selecting a field with the arrow keys. Then press OK to switch to edit mode.

The cursor can be moved using the ← | → arrow keys, the value underneath the cursor can be modified with ↓ | ↑. Confirm your changed values with OK and F2.

**Connecting the Antenna**
Connect the antenna cable with the antenna socket of your LANTIME. In case of a short-circuit, the following message appears in the display:

In such a case, switch off the device and check the antenna cable. Instructions for installing the antenna are included in the corresponding chapter „Mounting the Antenna“ of the manual which is available in the „Manual“ folder of the USB flash drive.
Configuration via the Web Interface
The system configuration can now be changed via the network using a WEB browser or a Telnet / SSH client.

Connect to the web interface by entering the IP address of the LANTIME into the address field of your web browser:

1. Accessing the Web Interface
   Type in the IP of your LANTIME into the address field http://xxx.xxxxxxxx

2. LOGIN
   user: root
   password: timeserver
7 Security User Guide / Security Advisories

This Chapter describes the configuration of a LANTIME series operating system (LTOS) in terms of security features. It is divided in the following sections: general overview, securing the management, securing the time services and additional information about event log delivery. Finally, some advisories for the update process of a LANTIME are given.

The general knowledge about public key infrastructures, RSA, symmetric keys and the protocols SSL, SSH, NTP and SNMP is assumed.
7.1 General Informations

Before starting with the configuration, take a look at Figure 7.1 to identify the possible services that can be configured to be secure.

In general, a secure management of the LANTIME is possible with SSH, HTTPS and SNMP. If the configuration via SNMP is desired, the usage of version 3 is the only way to get a secure connection to manage the system. It is a good practice to deactivate all services that are not in use, to minimize the attack surface. So if possible, only enable one of the services (SNMP has not the full configuration support, but you can activate the other services over SNMP)!

The delivery of secured time information is only available for NTP. Please note, that the NTP protocol only supports integrity and authenticity but no confidentiality. On the other hand, PTP can not be configured to be secure. The next protocol standard of PTP will also provide some security features, but at the moment you still have to fall back to NTP for secure time delivery.

Another important advisory is to use the newest browsers and service clients to support the selection of the best security algorithms for server and client communication. Also the existence of known vulnerabilities can be reduced by a fast patch conduct.
The TSU cards of Meinberg take a special case you have to deal with. Their opportunity to get connected via ssh over the network and their possibility to internally connect to the Meinberg CPU card leads to a back door, if not configured well. The Figure 7.2 shows this constellation. With default settings of the LANTIME-V7-firmware, the ssh connection is not possible over the network for TSU T20 GB and PXA 270 V2.4. If SSH is not desired at all on the TSU, just deactivate the SSH client on the PTP webpage like in Figure 7.3. If SSH is desired with a non default key, change the standard SSH public and private key on both sides (CPU and TSU). This can only be done by hand with a SSH connection. The keys are under "/config/ssh/usb0_rsa_key" on CPU and "./root/.ssh/authorized_keys" on TSU. When you have changed these keys, be aware that new additional TSU cards can not be accessed without credentials.

![Figure 7.3: Disable SSH on TSU](image)

Table: Security targets

The table shows the security goals of the protocols in short. The accountability is given through a detailed syslog of the actions performed by every user or process. It is not guaranteed that entries are not manipulated by admins and for that, the system can not prove the non-repudiation. The most, possible availabilty of the services is realized through current updates and IP banning. For more protection, implement web application firewalls and traditional firewalls in the network, that are able to identify and prevent DOS/DDOS attacks.

With all changes to the configuration keep in mind, that they are lost after a reboot or could be discarded by other admins or super users, if they are not saved in the startup configuration.
7.2 Securing Management

The most secure way to configure a LANTIME is to connect the client directly to the LANTIME, until only secure channels are established. This guide uses the web interface over ssl as example.

After connecting a reference clock and the following start procedure of a LANTIME, an IP address can be configured via the front panel (see chapter "LTOS Management and Monitoring → Via Web GUI"). Now it is possible to connect to the web interface using the configured ip address. Use the initial credentials to login.

User: root
Password: timeserver

After you connected successfully, the first thing to do is to check, if it exists a new firmware version (see section 7.8 for update instructions). After the update is performed, generate or inject a ssl certificate. This example uses a new one. Figure 7.4 shows the button to start the generation.

![Figure 7.4: Generate SSL certificate step 1](image)

On the next step you have to enter the information needed for the certificate (see also chapter "LTOS Management and Monitoring → Via Web Gui → Security"). Figure 7.5 shows the form. As key length, use 2048 or higher. Shorter durations of the period of validity are better than longer. In this example we select three years as a good trade of short duration and an acceptable management cost.

![Figure 7.5: Generate SSL certificate step 2](image)
You can view the generated certificate with the "Show SSL Certificate" button. Use it to compare it with the certificate provided by the browser on your next https connection to the LANTIME. Both should be identical!

The import process is illustrated in Figure 7.7. The numbers in the figure describe the sequence of actions to perform. Number four represents the comparison with the previously downloaded certificate of the LANTIME. If both certificates are identical, you can go ahead with step five to confirm the confidence of the LANTIME certificate. Modern browser configurations will show you that the connection is not safe when you use a self-signed certificate. Because of this behaviour, we recommend the implementation of a public key infrastructure to avoid the warning. For this purpose, you can generate a certificate request, download it, sign it and upload the signed certificate again via the web front end on Figure 7.4.
If the connection over https is possible, you can deactivate all other unused services like on Figure 7.8. Additionally, in this example only one network interface provides the https web interface. Thus, scenarios like a dedicated configuration network are possible, too.

For the next step, one other super user than root is needed. Go to section 7.3 to create one. After creation of the new super user, log in with its credentials and disable the root login under ‘Security → Login/Access → Disable Root Login’. Deactivate the front panel, USB port and local console under ‘Security → Front Panel’ if desired. In addition, you can set the remote access control to white listed IP addresses that are allowed to connect to the web interface (Hint: The Remote Access Control does not take effect for SSH connections). Figure 7.9 shows the menus.

The timeout for web sessions is configured on the “Security” tab under “Login / Access” which is displayed in Figure 7.10. Shorter durations minimize the security risk.

From now on, the LANTIME is well configured to be managed secure. Keep in mind to check if the IP configuration and remote access control work in the productive network environment.
 Optionally, you can configure SNMP to manage the LANTIME. The security options can be found under “Security → SNMP”. Figure 7.11 shows the menu. To establish a secure connection via SNMP you have to use version 3 and the authPriv mode. The additional parameters of version 3 are the user name (security name), the access rights, the authentication and privacy protocol/algorithms. Use SHA and AES as algorithms. As usual, longer passwords are preferred. Start the SNMP service on “Network → Network Services” tab afterwards.

Figure 7.11: SNMP options
7.3 User Management/Administration

This section describes the administration of user and authentication management. Therefore, it is divided in LANTIME origin and external user authentication. The LANTIME OS supports the two external authentication servers, Radius and TACACS+. You can also see "LTOS Management and Monitoring → Via Web GUI → System → External Authentication" for further information.

7.4 LANTIME User Management

The LANTIME delivers a build-in user configuration. The options are located under “System → User Management”. There are three different user groups: Super-User, Admin-User and Info-User. Super-Users are allowed to do everything, bash access included. Admin-Users are allowed to do everything that is on the web interface, but no operations that would grant super user rights.

Info-Users are just allowed to see all non-security relevant informations in the web interface. To create a User, use the form that is shown on Figure 7.12. Super-Users can create all user types. The Admin-User can create other Admin-Users and Info-Users. Enter a name, a password and the group of the user, then press the button Create User. If successful, the new user is displayed in the User List, right under the create user form. Choose the user names and passwords in a way that they are not predictable.

![Create User](image1)

Figure 7.12: Create new Super User

![User List](image2)

Figure 7.13: User List
For passwords, there are some additional options that are depicted in Figure 7.14. Choose a long password length and a periodical change interval. Additionally, you can use the secure password modifier to force a password containing many different character sets.

![Password Options](image)

Figure 7.14: Password Options

### 7.5 External User Authentication: Radius and TACACS+

In addition to the users managed by LANTIME itself, a Radius or TACACS+ connection can be used to authenticate users. This configuration is also located in the User Administration under Add External Authentication Server. Look at Figure 7.15 for the input options. You have to enable External Authentication first. Afterwards, choose radius or TACACS+ from the drop down menu and insert the hostname, the pre shared secret and the correct port. From now on, you are ready to login with the external authentication mechanism. At first the system checks the external server for the user. If no user exists with that credentials, the system checks the local users. It is described in ‘LTOS Management and Monitoring → Via Web GUI → External Authentication Options’ how to configure the external authentication server.

![External Authentication Options](image)

Figure 7.15: Webinterface Menu “System → User Management → External Authentication”
## 7.6 Securing Time Service NTP

The time service NTP provides an authenticated and integrity secured packet transmission. Currently, NTP autokey is considered to be not as secure as the symmetric key procedure. Therefore, this guide will use the symmetric key configuration. The chapter "LTOS Management and Monitoring → Via Web GUI → NTP Symmetric Keys" describes all configuration options in detail.

To configure a connection, the system needs a key. Either use newly generated or add existing keys in the key file over the button Edit NTP Keys under "NTP → NTP Symmetric Keys". If you automatically generate the keys by the system, MD5 and SHA1 keys will exist in the key file. Use the SHA1 keys for a better security. Figure 7.16 shows example keys. The key IDs have to be added to the trusted keys on "General Settings" menu point of NTP tab (see Figure 7.17). On "NTP Restrictions" menu you can deactivate mode 6 and 7 packet support. Optionally, activate access restriction here to grant access only to known IP addresses. The symmetric keys are used for every connection type, i.e. server to client, external NTP server, broadcasting, multicasting and manycasting.

Figure 7.16: Generated symmetric NTP keys

Figure 7.17: Trusted key IDs
The insertion points for the right key IDs are marked on Figure 7.18, 7.19 and 7.20. If the system is a MRS System, only one key can be configured for all external server (also see ‘LTOS Management and Monitoring → Via Web GUI → NTP → External NTP Server’). The configuration file of a client is shown in Figure 7.21. It contains the path to the key file, the trusted key IDs and the server IP which uses the key with ID 1 in this example.

![Figure 7.18: External server configuration](image)

![Figure 7.19: Broadcast configuration](image)
7.7 Event Log Delivery

The LANTIME offers many transport channels for event log informations and a fine grained notification selection for each of them. Currently, no channel can be configured to be secure, except SNMP. It is a good practice to collect event log informations on a central server to correlate and check them for anomalies, but be aware of potential security relevant information leakage if you do so.

The chapter "LTOS Management and Monitoring → Via Web GUI → Notification" describes the configuration options for the transport channels. If you use SNMP v3 with selected authPriv security level, also SNMP traps are securely transported. Configure SNMP authPriv level under Security!SNMP like in section 7.2 explained.
7.8 Update And Backup LANTIME Firmware

Download the latest LTOS on https://www.meinbergglobal.com/english/sw/firmware.htm. The downloaded LTOS file has to be uploaded via the LANTIME web interface under "System → Firmware/Software Update" like on Figure 7.22. In the next step, you have to confirm the update and activate the new firmware like in Figure 7.23. The update was successful if Figure 7.24 is displayed.

Figure 7.22: Upload firmware

Figure 7.23: Update process of the firmware

Figure 7.24: Successful firmware update
To take account of changes made by the customer, configuration files are not overridden automatically by a firmware update. Security relevant configuration files on the other hand are updated as long as no customer changes was made to the configuration before. If the system should work with the firmware configuration, although it is customized, a manual action is required. There are two ways to get the new configuration entries working.

![Services and Functions](image)

**Figure 7.25: Reset factory defaults**

The first way is to reset the factory defaults like on **Figure 7.25**. Be aware that all custom configurations will be lost, except the network configuration if you do it over the web interface. You are still able to reach the LANTIME over the current IP and services after the update.

But this also means, that your certificates, credentials and SSH keys are lost (it exists a backup on the flash memory) and you have to reconfigure everything else. The most accurate way, is to look in every configuration and to make a difference (diff command) to get information about the changes that will modify the security parameters. Subsequently, you have to edit the existing (current) configurations over a SSH connection. The most important configuration files and their equivalents in the new firmware are the following. The old state of the configuration files can always be viewed in the pre update configuration set.

```
new: /mnt/firmware/fw_x.xx.xxx/flash/firmware/OSV/packages/
web/files/copy/etc/webUI/ *.conf

current: /etc/webUI/webUI_custom.cfg file to link to another file or /etc/webUI/ *.conf

new: /mnt/firmware/fw_x.xx.xxx/flash/firmware/OSV/packages/
web/files/config/default/etc/ssl/openssl.cnf

current: /etc/ssl/openssl.cnf

new: /mnt/firmware/fw_x.xx.xxx/flash/firmware/OSV/packages/
network/files/config/default/etc/portauth/portauth_default.conf

current: /etc/portauth/portauth_default.conf

new: /mnt/firmware/fw_x.xx.xxx/flash/firmware/OSV/packages/
ssh/files/copy/etc/standard/sshd_config

current: /etc/ssh/ssh.cfg file to link to another file or /etc/standard/sshd.config
```

This list has no claim of completeness! It is only the minimum amount you should always check. We can not give you a complete list, because we do not know which configuration will be changed due to security enhancements in the future.

After the reset over the web interface, all certificates are exchanged to the factory defaults. You have to re-inject your own company signed certificate, the certificate you used before or a newly generated. Also the settings and keys for SSH, SNMP and NTP must be set again as explained in the sections before.

A backup of the LANTIME firmware, if downloaded or saved on flash of the LANTIME, is in clear text form. For this reason make sure, that no unauthorized person has access to it. The same takes effect for a diagnostic file.
8 Antenna and Receiver Information

There are 2 types of radio signals commonly used for timing applications: satellite signals from Global Navigation Satellite Systems (GNSS), and long wave signals from specific time code transmitters operated by some countries.

Most GNSS signals can be received world-wide, while long wave signals can only be received up to a certain distance around the transmitting station. Also, GNSS receivers can usually track the signals from several satellites at the same time, so the signal propagation delay can be determined and compensated automatically, while long wave receivers usually receive only the signal from a single station. Last but not least the available bandwidths and signal propagation characteristics are another reason why GNSS reception usually yields a higher degree of time accuracy than long wave reception.

8.1 Reference Time Sources

8.1.1 Meinberg GPS Receiver

The satellite radio clock was developed with the aim of providing users with a highly accurate time and frequency reference. High accuracy and the possibility of worldwide use, 24 hours a day, are the main features of this system, which receives its time information from the satellites of the Global Positioning System. The Global Positioning System (GPS) is a satellite-based system for radio-positioning, navigation, and time-transfer.

This system has been installed by the United States Department of Defense (Defense Department) and provides two levels of accuracy: the Standard Positioning Services (SPS) and the Precise Positioning Services (PPS).

The GPS satellites orbit the earth on six orbital tracks in 20,000 km of altitude once in about 12 hours. This ensures that at any time at least four satellites are in sight at any point on the earth. Four satellites must be received at the same time so that the receiver can determine its spatial position (x, y, z) and the deviation of its clock from the GPS system time.

Control stations on earth measure the orbits of the satellites and record the deviations of the atomic clocks carried on board from the GPS system time. The determined data are sent to the satellites and sent to earth as navigation data by the satellites. The highly precise track data of the satellites, called ephemerides, are needed so that the receiver can calculate the exact position of the satellites in space at any time. A set of track data with reduced accuracy is called almanac. With the aid of the almanacs, the receiver calculates at approximately known position and time, which of the satellites are visible from its location. Each of the satellites transmits its own ephemerides as well as the almanacs of all existing satellites. The GPS clock operates with the "Standard Positioning Service". The data stream of the satellites are decoded and evaluated by the microprocessor of the system, like that the GPS system time is reproduced with a deviation of less than 100 nsec. Different running times of the signals from the satellites to the receiver are automatically compensated by determining the receiver position. By tracking the main oscillator, a frequency accuracy of $1 \times 10^{-12}$ is achieved, depending on the oscillator type. At the same time, the age-related drift is compensated. The current correction value of the oscillator is stored in a non-volatile memory of the system.
8.1.2 Meinberg GNSS Receiver (GPS, GLONASS, Galileo, BeiDou)

High accuracy and the possibility of the world wide operation around the clock are the main features of the system, which receive his time information from the satellites of the American GPS (Global Positioning System), the European Galileo, the Russian GLONASS (Global Navigation Satellite System) and the Chinese BeiDou.

The Global Positioning System (GPS) is a GNSS operated by the US department of defense. Its purpose is to provide position, velocity and time for civilian and defense users on a global basis. The system currently consists of 32 medium earth orbit satellites and several ground control stations.

GLONASS is a GNSS operated by Russian Federation department of defense. Its purpose is to provide position, velocity and time for civilian and defense users on a global basis. The system consists of 24 medium earth orbit satellites and ground control stations. The GLONASS satellites circle the earth once on three orbital lanes in height of 19100km in about 12 hours.

Galileo is a GNSS operated by the European Union. Its purpose is to provide position, velocity and time for civilian users on a global basis. The system is currently not fully operational. It is eventually expected to consist of 30 medium earth orbit satellites. At the time of writing (early 2016), the Galileo system was still under development with only a few fully operational SVs. Therefore, the precise performance and reliability of u-blox receivers when receiving Galileo signals is effectively impossible to guarantee.

BeiDou is a GNSS operated by China. Its purpose is to initially provide position, velocity and time for users in Asia. In a later stage when the system is fully deployed it will have worldwide coverage. The full system will consist of five geostationary, five inclined geosynchronous and 27 medium earth orbit satellites, as well as control, upload and monitoring stations.

Characteristics
The GNS module is a combined GPS / Galileo / GLONASS / BeiDou receiver and operates with the “Standard Positioning Service” (GPS) or “Standard Precision” (Galileo, GLONASS, BeiDou). The data stream from the satellites is decoded by the microprocessor of the system. By analyzing the data, the GNSS system time can be reproduced very precisely. Different running times of the signals from the satellites to the receiver are automatically compensated by determining the receiver position. By tracking the main oscillator (Oven Controlled Xtal Oscillator, OCXO) a high frequency accuracy is achieved. At the same time, the aging-induced drift of the quartz is compensated. The current correction value for the oscillator is stored in a non-volatile memory of the system. This receiver is suitable not only for stationary operation but also for mobile use.

The Meinberg GLN receiver is the predecessor of the GNS clock and receives GPS, Glonass and BeiDou.
8.1.3 PZF - DCF77 Long Wave Receiver

The German long wave transmitter DCF77 started continuous operation in 1970. The introduction of time codes in 1973 built the basis for developing modern radio remote clocks. The DCF77 frequency and signal is derived from the atomic clocks of the Physikalisch-Technische Bundesanstalt (PTB) in Braunschweig, Germany, the national institute for science and technology and the highest technical authority of the Federal Republic of Germany for the field of metrology and physical safety engineering.

The carrier frequency of 77.5 kHz is amplitude modulated with time marks each second. The BCD-coding of the time telegram is done by shifting the amplitude to 25% for a period of 0.1s for a logical '0' and for 0.2s for a logical '1'. The receiver reconstructs the time frame by demodulating this DCF-signal. Because the AM signal is normally superimposed by interfering signals, filtering of the received signal is required. The resulting bandwidth-limiting causes a skew of the demodulated time marks which is in the range of 10 ms. Variations of the trigger level of the demodulator make the accuracy of the time marks worse by additional +/-3 ms. Because this precision is not sufficient for lots of applications, the PTB (Physical and Technical Institute of Germany) began to spread time information by using the correlation technique.

The DCF-transmitter is modulated with a pseudo-random phase noise in addition to the AM. The pseudo-random sequence (PZF) contains 512 bits which are transmitted by phase modulation between the AM-time marks. The bit sequence is built of the same number of logical '0' and logical '1' to get a symmetrical PZF to keep the average phase of the carrier constant. The length of one bit is 120 DCF-clocks, corresponding to 1.55 ms. The carrier of 77.5 kHz is modulated with a phase deviation of +/-10 per bit. The bit sequence is transmitted each second, it starts 200ms after the beginning of an AM second mark and ends shortly before the next one. Compared to an AM DCF77-receiver, the input filter of a correlation receiver can be dimensioned wideband width. The incoming signal is correlated with a reconstructed receiver-PZF. This correlation analysis allows the generation of time marks which have a skew of only some microseconds. In addition, the interference immunity is increased by this method because interference signals are suppressed by averaging the incoming signal. By sending the original or the complemented bit sequence, the BCD-coded time information is transmitted.

The absolute accuracy of the generated time frame depends on the quality of the receiver and the distance to the transmitter, but also on the conditions of transmission. Therefore, the absolute precision of the time frame is better in summer and at day than in winter and at night. The reason for this phenomenon is a difference in the portion of the sky wave which superimposes the ground wave. To check the accuracy of the time frame, the comparison of two systems with compensated propagation delay is meaningful.

The PZF radio clock is a precision receiver system for the time signal transmitter DCF77. It is available as a module for use in systems such as Meinberg IMS, LANTIME M300 models and as a computer plug-in card. The microprocessor of the system performs the correlation of a reproduced pseudo-random bit sequence with the PZF of the transmitter side and simultaneously decodes the AM time and date information of the DCF telegram. By evaluating the pseudo-random phase noise, a time raster can be generated which is up to a factor of a thousand more accurate than the ones of conventional AM radio clocks. In this way, an exact adjustment of the main oscillator of the radio-controlled clock is also possible, this allows it to be also used as a normal frequency generator, in addition to being used as a pure time receiver. If the PZF signal is temporarily unavailable for some reason, i.e. because a source of interference is in the vicinity, the radio clock will automatically switch to the AM signal – provided this is still receivable. The correlation receiver has a battery-buffered hardware clock, which takes over the time and date in the event of failure of the supply voltage.
8.1.4 MSF Receiver

The transmission of the MSF signal from Anthorn serves to distribute the British standard of the time and frequency signals. These standards are set by the National Physical Laboratory (NPL). The MSF signal provides sufficient field strength for use in the UK and can also be received in large parts of North and Western Europe. A simple on-off modulation of the carrier frequency (60kHz) is used to transmit BCD encoded time and date information. Each UTC second is marked with "off", preceded by at least 500 ms of carrier. This second marker is transmitted with an accuracy of +/-1 ms. The time code format is displayed via a minute frame, which is used to transfer the data to the next minute. The bits 'A' and 'B' are used to send the information (see graphic code format below).

The first second of the minute begins with a period of 500 ms with the carrier 'off', to serve as a minute marker. The other 59 (or, exceptionally, 60 or 58) seconds of the minute always begin with at least 100 ms 'off' and end with at least 700 ms of carrier 'on'. Seconds 01-16 carry information for the current minute about the difference (DUT1) between astronomical time and atomic time, and the remaining seconds convey the time and date code. The time and date code information is always given in terms of UK clock time and date, which is UTC in winter and UTC+1h when Summer Time is in effect, and it relates to the minute following that in which it is transmitted.

The MSF radio clock is a radio clock receiver system for the time signal transmitter MSF. It is available as a module for use in systems such as Meinberg IMS and LANTIME M300 models. The microprocessor of the system decodes the time and date information of the incoming AM signal. In this way, an exact adjustment of the main oscillator of the radio-controlled clock is also possible. The MSF receiver is equipped with a battery-buffered hardware clock, which takes over the time and date in the event of failure of the supply voltage.

**Code Format**

<table>
<thead>
<tr>
<th>Second 00</th>
<th>possible 100 bits/s information</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>BCD hour (00-23)</th>
<th>BCD minute (00-59)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>order</strong> 20 10 8 4 2 1 40 20 10 8 4 2 1</td>
<td></td>
</tr>
<tr>
<td><strong>Bit</strong> 39A 40A 41A 42A 43A 44A 45A 46A 47A 48A 49A 50A 51A</td>
<td></td>
</tr>
</tbody>
</table>

**Other Codes**

**Minute Identifier**

Bits 53A to 58A are all set permanently at '1' and are always preceded by bit 52A at '0' and followed by bit 59A at '0'. This sequence '01111110' never appears elsewhere in bit xxA, so it uniquely identifies the following second 00 minute marker. In minutes lengthened or shortened by a positive or negative leap second all these numbers are correspondingly increased or decreased by one (i.e. during these 61- or 59-second minutes the position of the time and date code is shifted by one second relative to the start of minute).

**Parity Bits**

The parity bits are providing an odd number of 1's.

- Bit 54B taken with bits 17A to 24A
- Bit 55B taken with bits 25A to 35A
- Bit 56B taken with bits 36A to 38A
- Bit 57B taken with bits 39A to 51A

**Summer Time**

When UK civil time is subject to a one-hour positive offset during part of the year, this period is indicated by setting bit 58B to '1'. Bit 53B is set to '1' during the 61 consecutive minutes immediately before a change, the last being minute 59, when bit 58B changes.

**Unused Bits**

The unused bits are currently set to '0', but may be used in the future.
8.1.5 WWVB Receiver

NIST radio station WWVB is located near Fort Collins, Colorado, on the same site as station WWV. The WWVB broadcast is used by millions of people throughout North America to synchronize consumer electronic timing products such as wall clocks, clock radios, and wristwatches. In addition, WWVB is used for high level applications including network time synchronization and frequency calibration. The WWVB transmission is maintained by the National Institute of Standards and Technology (NIST).

WWVB continuously broadcasts a time and frequency signal at 60 kHz. The carrier frequency provides a stable frequency reference traceable to the national standard. There are no voice announcements on the station, but a time code is synchronized with the 60 kHz carrier and broadcast continuously at the rate of 1 bit per second using pulse width modulation. The carrier power level is modulated to encode the time data. The carrier power is reduced by 17 dB at the start of each second, so that the leading edge of every negative going pulse is on time. Full power is restored 0.2 s later for a binary #0#, 0.5 s later for a binary #1#, or 0.8 s later to convey a position marker. The binary coded decimal (BCD) format is used, which combines binary digits to represent decimal numbers. The time code contains the year, day of year, hour, minute, second, and flags that indicate the status of Daylight Savings Time, leap year, and leap seconds. WWVB identifies itself by advancing its carrier phase 45 degrees at 10 minutes after the hour and returning to normal phase at 15 minutes after the hour. If you plot WWVB phase, this results in a phase step of approximately 2.08 microseconds.
8.1.6 TCR Receiver

The Board Meinberg TCR (Time Code Receiver) was designed for the decoding of unmodulated and modulated IRIG- and AFNOR-Timecodes. Modulated codes transport the time information by modulating a sinusoidal carrier signals amplitude whereas unmodulated signals employ a pulse width modulated DC signal.

The receivers automatic gain control allows the reception of signals within a range from abt. 600mVpp up to 8Vpp. The potential free input can be jumper selectable terminated in either 50 Ohm, 600 Ohm or 5 kOhm. Modulated codes are applied to the board via an on board SMB connector.

Abstract of Time Code

The transmission of coded timing signals began to take on widespread importance in the early 1950’s. Especially the US missile and space programs were the forces behind the development of these time codes, which were used for the correlation of data. The definition of time code formats was completely arbitrary and left to the individual ideas of each design engineer. Hundreds of different time codes were formed, some of which were standardized by the "Inter Range Instrumentation Group" (IRIG) in the early 60’s.

Except these ‘IRIG Time Codes’, other formats like NASA36, XR3 or 2137 are still in use. The TCR receiver generates the IRIG-B, AFNOR NFS 87-500 code as well as IEEE1344 code which is an IRIG code, extended by information for time zone, leap second and date.
8.2 GNSS Signal Reception

The satellites of most Global Navigation Satellite Systems (GNSS) like GPS, GLONASS, and Galileo are not stationary but circle round the globe in periods of several hours. Only few GNSS systems like the Chinese Beidou system work with stationary satellites. Such systems can only be received in certain regions of the Earth.

GNSS receivers need to track at least four satellites to determine their own position in space (x, y, z) as well as their time offset from the GNSS system time (t). Only if the receiver can determine its own position accurately the propagation delay of the satellite signals can also be compensated accurately, which is requirement to yield an accurate time. If the receiver position can only be determined less accurately then the accuracy of the derived time is also degraded.

GNSS satellite signals can only be received directly if no building is in the line-of-sight from the antenna to the satellite. The signals can eventually be reflected at buildings, etc., and the reflected signals can then be received. However, in this case the true signal propagation path is longer than expected, which causes a small error in the computed position, which in turn yields less accurate time.

Since most of the satellites are not stationary, the antenna has to be installed in a location with as much clear view of the sky as possible (e.g. on a rooftop) to allow for continuous, reliable reception and operation. Best reception is achieved when the antenna has a free view of 8° angular elevation above the horizon. If this is not possible then the antenna should be installed with the best free view to the sky in direction of the equator. Since the satellite orbits are located between latitudes 55° North and 55° South, this allows for the best possible reception.

Meinberg provides their own GPS receivers which operate with an antenna/converter unit and thus allow for very long antenna cables, but some devices also include GNSS receivers which support other satellite systems like GLONASS, or Galileo in addition to GPS. These receivers usually require a different type of antenna equipment which is described in chapter (4.1.2).
8.2.1 Meinberg GPS Antenna/Converter

8.2.1.1 Introduction

The Meinberg GPS antenna/converter unit combines a standard GPS patch antenna with a frequency converter which translates the original 1.5 GHz signal received from the GPS satellites to an intermediate frequency, so a standard coaxial cable type like RG58 can be used for antenna cable lengths up to 300 meters (1000 ft). If a low-loss cable type like RG213 is used then even 700 meters (2300 ft) between receiver and antenna are possible without requirement for an additional amplifier.

Surge protectors are optionally available and should be used in the antenna line to protect the receiver from high voltages spikes e.g. due to lightning strikes close to the antenna. The antenna/converter unit is remotely powered by the connected GPS receiver via the antenna cable, so no external power supply is required near the location of the antenna if a coaxial cable is used.

If more than a single GPS receiver are to be operated then a GPS antenna splitter can be used to distribute the GPS signal from a single antenna. The GPS antenna splitter provides 4 outputs and can be cascaded to supply even more than 4 receivers with the GPS signal.

Alternatively there is also a GPS Optical Antenna Link (GOAL) available which uses a fiber optic connection between the antenna and the receiver which allows for a length up to 2000 meters (6500 ft), and provides a high level of insulation and surge protection due to the optical transmission. Since the fiber optic connection is unable to provide the antenna with DC current, an extra power supply is required in this case at the location of the antenna.

Due to the specific requirements for remote powering and frequency conversion the Meinberg GPS equipment is not necessarily compatible with GPS equipment from 3rd party manufacturers.
8.2.1.2 Mounting and Installation of the GPS Antenna

Proper installation of the GPS antenna/converter unit is illustrated in the figure below:

Figure: GPS Antenna mounted on a pole with a free view of the sky. The optional surge protector keeps high voltage strikes through the antenna cable away from the receiver.

Mounting material (plastic pole and holders, clamps for wall or pole mounting) is shipped with all Meinberg GPS antennae for easy installation. A standard RG58 antenna cable of 20 meters length is included by default. If a different cable length is required then this can be ordered accordingly.

Surge protectors should be installed indoors, directly where the antenna cable comes in. The optionally delivered protection kit is not for outdoor usage. The ground lead should be kept as short as possible and has to be connected to building’s ground rod.

Up to four GPS receivers can be fed by a single antenna/down-converter unit by using an antenna splitter which can optionally be cascaded. The total length of an antenna cable from the antenna to each receiver must not exceed the specified maximum length according to the cable type. The position of the splitter in the antenna line does not matter.

Note:
If the antenna cable is assembled locally instead of using a cable shipped with the GPS receiver it has to be made sure that the connectors have been soldered and assembled properly, and that there is no short-circuit in the cable or in one of the connectors. Otherwise GPS reception may be degraded, or the GPS receiver can even be damaged.
8.2.2 General GNSS Antennae

Some Meinberg devices use alternate GNSS receivers which support other satellite systems like GLONASS, Galileo or BeiDou, in addition to GPS. These receivers can't be operated directly with the standard Meinberg antenna/converter unit described in chapter ‘Meinberg GPS Receiver’, so they require a different kind of antenna.

There are two different antenna versions available, one of which is more suited for stationary installation, while the other one should be preferred for mobile applications.

8.2.2.1 GNSS Antenna for Stationary Installation

The Multi GNSS Antenna is an active GNSS antenna which can receive the signals of the GPS, GLONASS, Galileo and Beidou satellite systems. It is very well suited for stationary installations, operates with a 5V DC supply voltage provided by the receiver, and has an integrated surge protection.

The antenna cable length can be up to 70 meters if a H155 low-loss coaxial cable is used.

Mounting and Installation of the GNSS/L1 Antenna

![Schematic diagram of mounting the Multi GNSS Antenna](image)
WARNING!
Antenna mounting without effective anti-fall protection

Danger to life due to fall!
- Pay attention to effective working safety when installing antennas!
- Never work without an effective anti-fall equipment!

WARNING!
Working on the antenna system during thunderstorms

Danger to life due to electrical shock!
- Do not carry out any work on the antenna system or the antenna cable if there is a risk of a lightning strike.
- Do not carry out any work on the antenna system if the safety distance to free lines and sequential circuits is exceeded.
8.2.2.2 GNSS Antenna for Mobile Applications

The **RV-76G** is an active GNSS antenna which can receive the signals of the GPS, GLONASS, and Galileo satellite systems. It operates with a 5V DC supply voltage provided by the receiver, and should be preferred for mobile applications. However, the maximum length of the antenna cable is limited depending on the cable type, e.g. 5 meters with RG174/U cable, so this antenna is less suitable for stationary installations.

![Installation drawing RV-76G antenna](image)

**WARNING!**

Antenna mounting without effective anti-fall protection

**Danger to life due to fall!**
- Pay attention to effective working safety when installing antennas!
- **Never** work without an effective anti-fall equipment!

**WARNING!**

Working on the antenna system during thunderstorms

**Danger to life due to electrical shock!**
- Do **not** carry out any work on the antenna system or the antenna cable if there is a risk of a lightning strike.
- Do **not** carry out any work on the antenna system if the safety distance to free lines and sequential circuits is exceeded.
8.2.3 Powering up a GNSS Receiver

If both the antenna and the power supply have been connected the system is ready to operate. Depending on the type of oscillator installed in the receiver it takes about 10 seconds (OCXO-LQ) until 3 minutes (OCXO-MQ / HQ) until the oscillator has warmed up and reached the required frequency accuracy.

If the receiver has some valid almanac data in its battery buffered memory and the receiver’s position has not changed significantly since its last operation the receiver can determine which satellites are in view. Only a single satellite needs to be received to synchronize and generate output pulses, so synchronization can be achieved at least one minute (OCXO-LQ) until 10 minutes (OCXO-MQ / HQ) after power-up. After 20 minutes of operation the OCXO is fully adjusted and the generated frequencies are within the specified tolerances.

If the receiver position has changed by some hundred kilometers since last operation, the expected satellites may not be in view after power-up. In this case the receiver switches to Warm Boot mode where it starts scanning for all possible satellites one after the other. Once the receiver can track at least 4 satellites at the same time it updates its own position and switches to Normal Operation.

If no valid data can be found in the battery buffered memory, e.g. because the battery has been disconnected or replaced, the receiver has to scan for satellites and collect the current almanac and ephemeris data first. This mode is called Cold Boot, and it takes at least 12 minutes until all required data have been collected. The reason is that the satellites send all data repeatedly once every 12 minutes. After data collection is complete the receiver switches to Warm Boot mode to scan for more satellites, and finally enters Normal Operation.

In the default configuration neither pulse and synthesizer outputs, nor the serial ports are enabled after power-up until synchronization has been achieved. However, it is possible to configure some or all of those outputs to be enabled immediately after power-up.

If the system starts up in a new environment (e.g. receiver position has changed or new power supply has been installed) it can take some minutes until the oscillator’s output frequency has been adjusted properly. In this case the accuracy of the output frequency and pulses is also reduced until the receiver’s control loops have settled again.

On the frontpanel (“Reference Time → Info GPS → GPS Satellites”) as well as via the Web GUI (“Clock → Receiver Information”) you can check the number of satellites that are in view (i.e. above the horizon) and considered good (i.e. are healthy and can be tracked).
8.3 Long Wave Signal Reception

8.3.1 Introduction

The longwave antenna AW02 is a weatherproof and temperature resistant active antenna for outdoor use. It includes a ferrite antenna for reception of the longwave signal, and an amplifier, both assembled in a plastic housing. The standard version has been designed to receive the signal from the German longwave transmitter DCF77 whose carrier frequency is 77.5 kHz. The DCF77 transmitter is operated by the German Physikalisch-Technische Bundesanstalt (PTB), and is located in Mainflingen near Frankfurt / Main. Its signal can be received in Germany and adjacent countries.

The variant AW02-MSF is available for the longwave transmitter MSF which is located in Anthorn / U.K., and transmits the time and frequency maintained by the U.K. National Physical Laboratory (NPL). The signal can be received throughout the U.K., and in wide parts of Northern and Western Europe.

Another variant is the AW02-WWVB which has been adapted for the WWVB radio station which is located in the United States near Fort Collins, Colorado, and is maintained by U.S. National Institute of Standards and Technology (NIST).

Even though these antenna variants are slightly different according to the characteristics of the associated transmitter, the basic requirements for installation are identical.

The longwave antennae can be operated with a cable length up to 300 meters (1000 ft) if standard RG58 coaxial cable is used. They are remotely powered by the receiver via the antenna cable, so no external power supply is required near the location of the antenna if a direct coaxial cable is used.

Surge protectors are optionally available and should be used in the antenna line to protect the receiver from high voltages spikes e.g. due to lightning strikes close to the antenna.

For longer distances from the antenna to the receiver an optional amplifier can be used, which requires an extra power supply. The BLV device is an amplifier with integrated surge protector.

Alternatively there is a DCF Optical Antenna Link (DOAL) available which uses a fiber optic connection between the antenna and the receiver which allows for a length up to 2000 meters (6500 ft), providing a high level of insulation and surge protection due to the optical transmission. Again, the default device has been designed for DCF77, but there are also variants for MSF and WWVB available. Since the fiber optic connection is unable to provide the antenna with DC current, an extra power supply is required in this case at the location of the antenna.

Longwave receiver equipment from Meinberg has specifically been designed for Meinberg devices and is not necessarily compatible with receivers from 3rd party manufacturers.
8.3.2 Mounting and Installation of a Longwave Antenna

The careful selection of the antenna location should be at the beginning of each antenna installation. It determines the reception quality and therefore the availability of the DCF77 reception signal decisively. In principle, a DCF77 reception within buildings is possible, however, the DCF77 reception may deteriorate due to metallic objects (e.g. reinforced concrete walls, metal facades, heat protection glazing etc.) that shield or attenuate the reception.

For this reason we always recommend to mount the antenna outside of buildings. This has the advantage that the signal interference distance to electronic devices in buildings is usually enhances and the reliability of the synchronisation is thus significantly increased.

Proper installation of an antenna for DCF77, MSF, or WWVB is illustrated in the figure below:

![Figure: Longwave antenna mounted on a wall. The optional surge protector keeps high voltage strikes through the antenna cable away from the receiver.](image-url)
The antenna has to be aligned horizontally in longitudinal direction to the transmitter, i.e. in direction to Mainflingen near Frankfurt/Main in case of DCF77, or in direction to the location of the MSF or WWVB receiver accordingly.

If the antenna is not aligned properly then signal reception is degraded, which can result in a limited time accuracy. The antenna should be installed with a minimum distance of 30 cm away from all metal objects and possibly any microcomputers and electrical devices (engines, electricity, etc.). A distance of several meters from TV and computer monitors should be considered as well.

The best method to align a longwave antenna is to turn the antenna slowly until the monitored signal level is minimized, and then turn the antenna by $90^\circ$ to achieve maximum reception. However, a high signal level alone is not a guarantee for good reception since it can even be caused by electrical noise in the associated frequency range. For standard longwave receivers it is important that the modulation mark is blinking exactly once per second, without intermediate flickering.

DCF77/PZF receivers use correlation techniques to decode the phase modulation provided by DCF77, and with these types of receiver the maximum interference immunity can be found by looking at the autocorrelation parameter displayed in the display menu “PZF-STATE”. The displayed value should be as close as possible to 100 % for best reception.

---

**WARNING!**
Antenna mounting without effective anti-fall protection

**Danger to life due to fall!**
- Pay attention to effective working safety when installing antennas!
- **Never** work without an effective anti-fall equipment!

---

**WARNING!**
Working on the antenna system during thunderstorms

**Danger to life due to electrical shock!**
- Do not carry out any work on the antenna system or the antenna cable if there is a risk of a lightning strike.
- Do not carry out any work on the antenna system if the safety distance to free lines and sequential circuits is exceeded.
8.3.3 DCF77 / PZF Receiver

If both the antenna and the power supply have been connected the system is ready to operate. After power up it takes up to three minutes for the receiver to synchronize, if reception is good enough. A high "Correlation & Field" is an indicator for a good signal quality.

To check the field strength and the signal correlation value, select in the Front Panel "Reference Time → Info PZF → Correlation & Field".

The correlation "State" starts in a "raw" mode, when the receiver tries to find the initial correlation. When good correlation has been found the receiver checks it 20 times: this state is labeled "check" and the correlation value is increased from 1 to 20. If the correlation quality stays good the state changes to the "fine" mode. The signal strength should be 100 or higher.

If no correlation with the incoming signal is possible then the clock changes automatically to DCF77 AM reception mode and tries to decode the second marks.

For further detailed clock configuration, please refer to the Chapter Clock”.

9 LTOS7 Management and Monitoring

9.1 Via Web GUI

9.1.1 Main Menu

This chapter provides you with configuration options and status information of your LANTIME system accessed via Web GUI. The main page contains an overview of the most important configuration and status parameters for the system.

- Information about LANTIME model and software
- Network information
- Receiver status
- NTP status
- PTP status (option)
- Last messages
- Statistics (NTP/MRS Performance, NTP Access ...)
- Extended Statistics (MRS - external reference input signals)
- Documentation (Manuals), support information

The field in the lower section shows the last messages of the system with a timestamp added. The newest messages are on top of the list. This is the content of the file /var/log/lantime_messages, which is created after every start of the system (and is lost after a power off or reboot).

By using the navigation on top of the page you can reach a number of configuration menus, which are described in the following chapters.
9 LTOS7 Management and Monitoring

9.1.1.1 Introduction

To start a http or a secured https session with the Web Interface running on the CPU of your LANTIME system, you need to open your internet browser and type in the IP address of the interface you are using for this connection. Per default configuration https protocol is enabled at each network interface. Http requests are automatically redirected to https.

If you wish to use only one dedicated network interface for management and monitoring and the rest for other services you can find the corresponding configuration options in the Chapter "LTOS Configuration → Web → Network" in the submenu Network Services.

If the connection with the LANTIME is established correctly you will be prompted to enter login data to start the web session. Per default the entering user-name/password are: root/timeserver. For security reasons you are advised to change the default credentials after the first login. The corresponding user administration settings can be found in the Chapter "LTOS6 Configuration → Web → System" in the submenu User Management.

After entering the correct password, the main menu page of the web interface of a LANTIME system shows up. The main page contains an overview of the most important configuration and status parameters of the system, including:

- general information (model name, serial number, uptime since last reboot)
- assigned network and PTP interfaces (both in IPv4 or IPv6 configuration)
- receiver status information (sync or not, for GNSS receivers some additional satellite data)
- SHS (Secure Hybrid System) status in redundant receiver configuration, which provides a plausibility mode where the incoming times of both time signals are continuously compared against each other. For more information about the SHS mode and the corresponding settings you can find in Chapter "LTOS6 Configuration → Web GUI → Security → SHS Configuration".

9.1.1.2 How to navigate through the Web Interface

By using the navigation on top of the page you can reach a number of configuration menus, which are described in the following chapters.

Scrolling down the main page you will find a section containing last log messages generated during the LANTIME operation. The messages in this field are limited to the last 50 and are chronologically ordered. The messages are stored in the file /var/log/lantime_messages, which is created after every start of the system (and is lost after a power off or reboot). To view all log messages in the log file you would have to use the CLI (Command Line Interface). For your reference, a list of available CLI commands for LANTIME management and monitoring is provided in the Command Line Reference.
9.1.1.3 Web Interface - Notifications and Alarms

At the top of the main page in the right corner you can find an image of the status LED lamps which are physically located at the front site of a LANTIME system, in models with an integrated front panel unit. When the system is in operation and everything runs as expected, the upper three status LEDs are turned to green and the Alarm indicator is switched off. If you experience after the powering up the system and after the startup has been completed that one or more LEDs are switched on red, please proceed to the Chapter on Troubleshooting and Alarming.

Please note: startup of the system can take a several minutes, depending on the hardware configuration of your system.

Next to the status LEDs you will see displayed all active alarms currently present on a LANTIME with critical and error severity levels. With a mouse click over the alarms you will reach a table of notification events with red marked indicators at the events which triggered the alarms.

For further information how to eliminate a cause of each individual alarm, proceed to the Chapter on Troubleshooting and Alarming.

Next to the alarm area in the main page there is a field with informational data about your login status and information to which access-level group you belong as a current user. There are three types of users: Super-User, Admin-User and Info-User. The exact definitions of the three different user types and their access-level rights you can find in Chapter "LTOS6 → Web GUI → System-> User Management".

At the top right corner of the main page you can see a few icons. The displayed flag indicates the language pack which is currently activated for the web interface display. For the moment you can choose between English and German languages packs.

Next to the language flag, there is an icon showing a doctor’s stethoscope linked with a diagnostic file of the system, which includes all the necessary data for diagnostic and troubleshooting of the device. By clicking this icon a current diagnostic file will immediately start to download for you to save it to your local computer for a further use. The downloading can take up to 60 seconds, depending on the file size, which can be several MB. In the diagnostic file all the data about the system configuration and log messages are stored. The diagnostic file can be also an important tool for the Meinberg support team if you need some help with the configuration or you experience issues which you can not solve on your own. More about the diag file see Chapter "LTOS6 Configuration → via Web GUI → System → Download Diagnostic File".

The web interface is divided into several dialogue menus, where some of the dialogues (e.g. PTP; IO Config and SyncMon) depend on the hardware components which are integrated in the LANTIME system and only appear in systems with a corresponding configuration. The rest of the dialogues are common to all LANTIME and IMS systems.

You can move between the dialogues by clicking each individual name tag at the top of the menu line. When you click on the Logout tag, your Web session with the LANTIME device will be terminated immediately.

The two dialogues "Main" and "SyncMon" deliver you the status information about the LANTIME system after the last reboot. The rest of the dialogues provide configurations of features for the LANTIME operation and services. The dialogues with feature configurations are presented in a tree structure, where each submenu can be extended into a subtree by clicking at the "+" sign at the beginning of the submenu row. When you open the dialogue, the "+" will turn in "-" and when you click the "-" icon the currently open dialogue will close. You can have a few dialogues open at the same time in the currently selected menu (see the example on the next page).
Generally, in any configuration menu you are located, when you fill in or edit one or more feature fields at the end you need to confirm the setting by clicking the “Save Settings” button at the bottom of the page. By doing so and if the setting has been carried out successfully, you will receive a dialogue in the Main Menu with a confirmation message written on a green field. At the same time when a new configuration has been applied a log message will appear in the list of last messages in the Main Menu saying: “Device Configuration Changed”.

Figure: A tree structure of each menu. Opening a subtree by clicking a “+” and closing by “−” at the beginning of the submenu name
Figure: Settings saved successfully. Affected services have been restarted

A Saving startup configuration dialogue. Options for saving, discarding the current configuration and showing changes between the startup configuration and the current one.

Apart of the configuration message you will receive also an attention notice displayed on a yellow bar, saying: 'Current configuration is not yet marked as a startup configuration'. This means that you need to confirm the new configuration first by clicking on a "Save as startup configuration now" button if you want to keep it as a startup configuration by the next startup of the system. By clicking this button you will receive another confirmation message saying: "Activate current configuration really as startup configuration?" which you confirm by clicking the "OK" button. The new configuration has now become the startup configuration on your LANTIME system.

On the other hand, if you want to return to the last saved startup configuration then you select "Discard current configuration" button when the message on a yellow bar appears.

Each entry you fill in in the provided dialogues is checked for plausibility for that particular field. If you for example used wrong characters (e.g. letters in the IP Address configuration or any special characters which are not allowed) or you provided an invalid network configuration then you will receive a message displayed on a red bar saying a type of error and at which feature entry it occurred. The false entry will not be accepted by the system, neither the rest of any new settings you may have configured by that time, therefore you will have to redo the configuration steps again. See an example of a warning message if an error by entering a feature occurs.

Figure: A display of a warning message with a type of error and indication to which feature it belongs

Allowed signs and special characters which you can use to fill in dialogue boxes you can find in the chapter 'Before you Start → Text and Syntax Conventions'.

For configuration of the system features now proceed to the dedicated menu which is described in a corresponding chapter.
9.1.2 Network

9.1.2.1 Main Network Information

Hostname
The hostname of the LANTIME is a unique name of a computer in a network. Each IP address configured on the LANTIME is assigned to this hostname.

Domain
This field is used to configure the network domain name. A network domain name is a text-based label easier to memorize than the numerical addresses used in the Internet protocol (e.g. meinberg.de).

Nameserver1
IP Address of the primary DNS Server in the network. The DNS server is used to resolve IP addresses as well as hostnames in a network.

Nameserver2
An alternate nameserver can be defined here.
9.1.2.2 Default Gateways

In this menu you can configure default gateways to be used for IPv4 and IPv6. For a default gateway, a "default" entry is created in the main routing table of a LANTIME. If the LANTIME does not have a direct route or a routing rule to a destination IP, it will always attempt to reach the destination via the default gateway.

**IPv4 Gateway**  
Configuration of the default IPv4 gateway.

**IPv6 Gateway**  
Configuration of the default IPv6 gateway.

9.1.2.3 Network Services

In this submenu you can enable or disable various services for the existing virtual network interfaces. The +/- buttons can be used to select or deselect entire rows or columns in the matrix.

The following service states are possible:

- A service has been activated for at least one virtual interface and is active.
- Service has not been activated for any virtual interface and is therefore stopped.

The following services are supported by the LANTIME:

- **NTP:** Network Time Protocol, UDP Port 123
- **HTTP:** Hyper Transfer Protocol, TCP Port 80
- **HTTPS:** Hyper Transfer Protocol Secure, TCP Port 443
- **TELNET:** Teletype Network, TCP Port 23
- **SSH:** Secure Shell, TCP Port 22
- **SNMP:** Simple Network Management Protocol, UDP Port 161 / 162 (Traps)
- **FTP:** File Transfer Protocol, TCP Port 20
- **TIME:** Time Protocol, TCP/UDP Port 37
- **DAYTIME:** UDP Port 13
- **FPC:** Emulates the FrontPanel of a LANTIME and maps it in a browser.
- **WEBSHELL:** Login to a command line interface of a Lantime via a webbrowser. WEBSHELL works on port 4200. Input in the web browser: [IP/HOSTNAME]: 4200
9.1.2.4 Physical Network Configuration

Net Link Mode
Allows you to configure the network connection mode of the interface. You can choose among supported link modes of the respective physical interface.

The default value AUTO (Autonegotiation) can remain unchanged under normal circumstances. Autonegotiation refers to a method which allows two interconnected Ethernet devices to independently negotiate the maximum possible transmission speed and the duplex method and to configure them accordingly.

Monitor Interface
As soon as one of the selected network ports has no link, this status will be indicated by a red “Network” LED on the front panel and the “Network Link Down” event will be reported. If a network link is available on all selected ports, the “Network” LED on the front panel will light up green.

Bonding
Here, 2 or more physical network ports can be grouped into a bond (group). The LANTIME supports the bonding modes “Active – Backup” and “LACP”. The mode to be used can be selected in the submenu “Network → Miscellaneous → Bonding-Mode”. For more information about how the two modes work, see the “Miscellaneous” submenu.
PRP
PRP stands for Parallel Redundancy Protocol and is defined in the standard IEC 62439-3 since 2010. PRP is Layer-2 based and has been developed for computer networks which are in need of a reliable solution regarding high availability and operational functionality. A LANTIME with two or more interfaces, running firmware 6.22.001 or higher, has the ability to act as a DAN (‘Dual Attached Node’ – a device which is connected to both redundant networks).

As of LANTIME firmware version 7.0, PRP can also be conveniently set via the web interface menu "Network → Physical Network Configuration". Select the same PRP group for at least two interfaces in the drop-down menu "Bonding".

IPv6 Mode
Activation or deactivation of the IPv6 protocol.

MAC Address
Media Access Control, shows the MAC address of the given physical interface.

Assigned Virtual Interfaces
Indicates which virtual interfaces are assigned to the given physical interface.

Port Power Status
This feature is available in IMS systems, where several physical interfaces can be available. The port power status is an indicator if a particular physical interface is powered on or off.
9.1.2.5 Network Interfaces

In this menu the virtual interfaces of the LANTIME are managed. Up to 99 virtual interfaces can be assigned to the available physical ports. The name of the virtual interface consists of a consecutive number of a physical interface and the number of a virtual interface (starting with zero).

The example above shows a configuration in which a total of three virtual interfaces are assigned to the physical interface lan0, namely lan0:0, lan1:1 and lan1:2.

In the case of an active bond, the physical interface is replaced by the name of the bonding group, for example bond0:0.

Add interface
With this button a new virtual interface can be created. The new interface is assigned by default to the physical port lan0 and is added at the end of the row of the existing virtual interfaces. The assignment can be changed in the "Miscellaneous" tab.

Submenu IPv4:
In this submenu the IPv4 parameters can be configured or the current configuration given by the DHCP server can be displayed.

TCP/IP address: IPv4-Address of the given interface.
Netmask: Configuration of the subnetmask for the given interface.
Gateway: Configuration of an interface-specific gateway. This setting must be made only if the IP of the interface is NOT in the same subnet as the default gateway and the cross-network traffic in the subnet should be enabled via the gateway.
Enable DHCP-Client: With this setting a DHCP client can be activated for the automatic assignment of the network configuration by a DHCP server.
Submenu IPv6:
In this menu the IPv6 parameters can be configured or the configuration given by a DHCP server can be displayed.

TCP/IP address: Ipv6-Address of the given interface
Enable DHCP-Client: With this setting a DHCPv6 client can be activated for the automatic assignment of the network configuration by a DHCPv6 server.

Submenu Misc:

Assigned Interface: Determines which physical network is associated with the currently selected virtual interface.

"Virtual Interface" Delete Button: Deletes the currently selected virtual interface.

MAC Address: Displays the MAC address of the assigned physical network port

Label: Individual text-description of the interface (alias).

Submenu VLAN:
Enable VLAN Option: Activation of the tagged VLAN function for the selected virtual interface.

VLAN-Tag (0-4094): VLAN tags from 0-4094 can be entered here. The selected tag is inserted into the data area of an Ethernet packet.

Priority: PCP (Priority Code Point). Sets the priority of an Ethernet frame. Priorities can be set between a low priority, value 1 and a high priority, value 7.

The Priority value 0 corresponds to the Best Effort.
**Submenu Cluster:**

The Cluster mode is a method for providing redundant time synchronization by grouping (clustering) multiple LANTIME NTP servers. Within this group, the participating NTP servers continuously exchange status and quality information with each other. The status information is compared among each other and by a special algorithm a decision is made, which of the NTP servers should act as a current MASTER in the network. The rest of the group acts as SLAVE and stays passive as a backup. If the current master loses its synchronization source or any other failure occurs, another NTP server from the cluster takes over the master role. The current master responds to requests from NTP clients via a common cluster IP. Even if the master is replaced by another NTP server, this IP does not change.

The configuration of a NTP cluster is useful if at the side of NTP clients only one IP address for an external NTP server can be configured and redundancy is still required.

The current master is selected according to the following parameters in this order:

1. NTP status (sync, not sync);
2. Priority (configurable by the user, the lowest value has the highest priority, default = 0);
3. Ref-Clock Type – GNSS receivers such as GPS have the highest rating;
4. Ref-Clock Status (sync, not sync).
9.1.2.6 Cluster Configuration

Enable Cluster Option: The cluster function can be activated via this selection box.

Mode: The cluster members can share their status information either via multicast or unicast messages. For multicast, a cluster multicast address 239.192.0.1 is used by default. This setting can be changed in the menu "Network → Miscellaneous". In addition, the network port which is used for the cluster communication can be changed there. By default, port 7000 is used for the cluster messages.

TCP/IP Address: IP address of the NTP cluster interface. The same cluster IP needs to be configured on all cluster members. It is recommended to configure a cluster IP in the same subnet as the corresponding virtual interface.

Netmask: Netmask Configuration for the cluster interface.

Priority: The priority set here is taken into account when the MASTER is determined by the cluster algorithm. The lowest value has the highest priority.

Example configuration for a multicast cluster:

Example configuration for an unicast cluster:

In the Unicast cluster, the IP addresses of the cluster members must be entered in the "Other IPv4 Member" field.
9.1.2.7 Miscellaneous

Cluster Multicast Address:
Configuration of the cluster multicast address. Via this address, LANTIME cluster members exchange their status messages if Multicast mode is selected.

Cluster Port:
Configuration of a free network port for the cluster communication. Per default this port is set to 7000.

DSCP NTP Classification:
DSCP = Differential Service Code Point. DSCP is generally a method for prioritizing the traffic via IP. On the LANTIME, this setting allows the NTP packets to be assigned to a certain traffic class. The information about the traffic class is inserted into a header of a IPv4 packet. Routers can evaluate this information and handle the NTP packets as prioritized.

Bonding-Mode:
In the menu "Network → Physical Network Configuration", two or more physical network ports can be grouped into a bond (group). The Bonding Mode is used to configure either the "ACTIVE BACKUP" or the 'LACP' mode (Link Aggregation Control Protocol), which are supported on the LANTIME.

ACTIVE-BACKUP:
One physical interface in the bonding group acts as an "active slave". All network traffic of a LANTIME Bond runs through this interface. The other physical interfaces in the bonding group are passive. In case the current active interface loses the network connection, the passive interface seamlessly takes over. Even the MAC address of the network port remains unchanged.

LACP: LACP (802.3ad) allows a combination of multiple physical connections to a logical one. This results in a load sharing and, in addition, increases the safety in case of a failure compared to "Active Backup". It is important that other connected network devices also support LACP and the network ports are configured accordingly.
9.1.2.8 Extended Network Configuration

In the Extended Network Configuration, a bash script can be edited, which is executed automatically each time the LANTIME is rebooted or a network-related configuration changes.

```
#!/bin/bash

# Example how to setup an additional route
route add -net 10.109.33.64 network 255.255.255.0 gw 193.188.250.123 lan0:
```
9.1.3 Notification

9.1.3.1 External Syslog Server

All information which is written into SYSLOG (/var/log/messages) on the LANTIME, can also be forwarded to a remote server.
Syslog-Address(es):
You can enter up to 2 external Syslog Servers via the webinterface. As standard, the reachability of the Syslog Server is checked via Ping/ICMP. If the registered Syslog Server cannot be reached, it will not be entered into the Syslog configuration file /etc/syslog-ng/syslog-ng.conf. In case IMCP is not allowed in the network, due to firewall regulations, you can switch off the pingcheck via the manual network configuration. To proceed navigate as described down below:

"System Page → Services and Functions → Manual Configuration → Network Configuration": Enter the value 'NO' for the Parameter "SYSLOGPINGCHECK" and save the new settings.

Minimum Log Level:
Log Level Configuration

Transport-Protocol:
Transport - Protocol Configuration:
UDP - connectionless transmission
TCP - connection oriented

Port:
Configuration of the network port which is to be used. As default, IANA has registered port 514 for syslog messages.
9.1.3.2 Email Information

The LANTIME is able to inform about certain system events via e-mail. In the menu “Email Information” you can make the necessary settings. In the submenu “Notifications” you can select the system events, for which the LANTIME has to send out a notification e-mail.

| **Recipient:** | E-mail of the desired recipient. |
| **Sender:** | Address of the sender. |
| **Smarthost:** | To send the e-mails you require a smarthost (relay-server). Please enter the server address here. |
| **Port:** | Network port configuration. Default setting is 25, because the SMTP (Simple Mail Transfer Protocol) uses TCP Port 25 as standard. |
| **Activate Authentication:** (Checkbox) | Many mail servers require a valid authentication. Please check mark the box to activate it. |
| **Username/ Password:** | Please enter a valid access for the e-mail server. |
| **Additional E-mail Recipients:** | Configuration of additional e-mail recipients. |
9.1.3.3 SNMP Trap Receiver

The LANTIME is able to inform about certain system events with the help of SNMP traps. In the menu "SNMP Trap Receiver" you can configure up to 4 trap receiver. In the submenu "Notifications" you can select the system events, for which the LANTIME has to send an SNMP Trap.

<table>
<thead>
<tr>
<th>SNMP Trap Receiver</th>
<th>Community</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>SNMP v3</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>SNMP v3</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>SNMP v3</td>
</tr>
<tr>
<td>4</td>
<td></td>
<td>SNMP v3</td>
</tr>
</tbody>
</table>

Number of Retries: 3
Timeout (seconds): 3

SNMP Trap Receiver: IP address or hostname of the SNMP trap receiver.

Community: SNMP Read Community of the Trap Receiver.

Version: SNMP version to use.

Number of Retries: Specifies the value a lantimes retries to send a Trap.

Timeout: Connection timeout value.
9.1.3.4 VP100/NET Display Information

The Meinberg VP100 / 20NET network display is used to display the time and date. This display has an integrated network card and a SNTP client. The time is taken from any NTP time server via the NTP protocol and thus the internal clock is adjusted. This display can also display any characters as scrolling text. All LANTIME alarm messages can be displayed as text messages on the display. In the submenu "Notifications", you can select the system events which are to be sent to the display by the LANTIME. A message appears three times in succession as a scrolling text on the display.

Display: IP Address of the network display.

Serial number: You have to enter the correct serial number of the display here. The serial number is displayed after pressing the red SET button four times.
9.1.3.5 Notifications

User-defined Notifications
A freely definable script which should be executed when certain system events occur, can be created via the "User-defined notification" menu item. This script can be viewed and edited via the button "Notification Edit". Upon delivery this script contains a few comments:

```
#!/bin/bash
# Example:
# $1 : notification message number
# $2 : standard notification message text
#
# Output the message to file
# echo $1 $2 > /notification.txt
#
# Sending message to binary
# /mnt/flash/my_bin $1 $2
#
# Sending an e-mail
# echo -e "Subject: $2\n$1" | sendmail -f Lantime info@meinberg.de
#
# Add message to syslog
```

In the submenu "Notification Events", you can select the system events on which the script should be executed.
## Miscellaneous

The network heartbeat describes a function, with which the LANTIME cyclically sends an SNMP trap to the configured SNMP trap receivers to report itself as "alive" and "active".

The SNMP OID of the trap is: 1.3.6.1.4.1.5597.30.3.0.88 (mbgLtNgTrapHeartbeat).

**Activate Heartbeat:** The heartbeat can be activated via this checkbox

**Heartbeat-Intervall (m):** Heartbeat interval in minutes.
9.1.3.6 Notification Events

The "Notification Events" submenu provides an overview of all system events that may occur during LANTIME operation. The checkboxes can be used to configure external alarms for each event. The following information channels are available:

**EMAIL:** Sends an e-mail based on the e-mail configuration (see chapter "E-mail Information")

**SNMP:** Sends an SNMP Trap to the configured SNMP Trap (see chapter "SNMP Trap Receivers")

**DISP:** Shows the notifications on the configured network displays (see chapter "VP100/NET Display Information")

**USER:** Activates the user-defined script (see chapter "Notifications")

**ALED:** When the event occurs, the alarm LED of the LANTIME will light up

**RELAY:** When the event occurs, the error relay at the LANTIME is set to ERROR (see chapter "Error Relays")

1) Information; 2) Alarm; 3) Last change

**Automatic Event Repeat:** An interval can be configured, with which notifications are sent again.

**Max. Number of Repetitions:** The number of repetitions can be limited by this parameter.
Reset IMS Error

Removing an IMS module triggers a permanent error in the system. If modules are intentionally removed, the "Reset IMS Error" button at the bottom of the event table is available in the "Notifications" submenu. With this button all registered IMS errors can be reset.
### 9.1.3.7 Overview for all Events

<table>
<thead>
<tr>
<th>Event</th>

**9 LTOS7 Management and Monitoring**

LANTIME Firmware 7.00  Date: 25th October 2019  95
9.1.4 Security

This page allows to configure access restrictions and snmp. It also provides the functionality to handle SSH keys and the HTTPS certificate.

If unsure of required values please contact the network security administrator and provide these parameters.

Login/Access
The "Login" menu allows you to set general security settings for the login behavior of the LANTIME.

Disable Root Login:
This function can only be activated by an admin user or by a super user. If this function is active, the 'root' user can no longer log on to the LANTIME.

Remote Access Control:
In this configuration file, you can configure an access control for the LANTIME web interface based on the IP protocol. In this file, you can enter the IP addresses to be allowed to access the Web interface. After the first entry, access to all other clients is automatically blocked. Individual client IPs or entire subnets can be configured.

Shell Timeout:
Defines a timeout in seconds. After expiration of this period without any user interaction, the current session on the command line will be terminated for the logged-in user.

Web Timeout:
The parameter Web Timeout defines how many minutes of inactivity can pass before a user is automatically logged out of the Web interface.
Disable auto refresh on main page:
Prevents automatic reloading of the web interface in 60 seconds, as long as a user is in the main LANTIME web interface.

Front Panel:
Contains general security settings for the front panel of the LANTIME.

Lock Front Panel:
When the function is activated, the front panel of a LANTIME is disabled.

Disable USB Port:
After activating the feature, the USB port of a LANTIME at the front panel is deactivated and connected USB sticks can not be detected.

Checkbox “Automatically save and apply configuration which was uploaded via USB interface”
You can install a previously saved configuration on your LANTIME via the USB stick menu, if you have activated this check box, the uploaded configuration will be taken over directly as the start configuration.

Checkbox “Automatically activate firmware which was installed via USB interface”
By activating this checkbox, a firmware version loaded via the USB menu on the LANTIME will be directly taken over as active firmware.

Also see USB Stick Menu.
9.1.4.1 SSH - Secure Shell

Via "Secure Shell Login" (SSH) it is possible to establish a secured connection to the LANTIME. All data is encrypted during the transmission over Ethernet. To use this service, SSH must be enabled on each interface in the network settings (read also the configuration chapter 9.1.2.3 "Web GUI → Network → Network Services").

<table>
<thead>
<tr>
<th>SSH</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key Length</strong></td>
</tr>
<tr>
<td>4096 * * Bits</td>
</tr>
<tr>
<td><strong>Generate SSH Key</strong></td>
</tr>
<tr>
<td><strong>Show SSH Key</strong></td>
</tr>
</tbody>
</table>

**Key Length (Bits):**
Determines the key length for a new key to be generated.

**Generate SSH Key:**
Generates a key pair, consisting of a public and private key, in configurable length.

**Show SSH Key:**
You can use this button to display the public SSH keys of a LANTIME.
9.1.4.2 HTTPS Certificate

HTTPS is a standard for encrypted transmission of data between web browser and web server. It relies on X.509 certificates and asymmetric crypto procedures. The timeserver uses these certificates to authenticate itself to a client (web browser). The first time a web browser connects to the HTTPS web server of your LANTIME, you are asked to accept the certificate of the web server.

To make sure that you are talking to your known timeserver, check the certificate and accept it, if it matches the one stored on the LANTIME. All further connections are comparing the certificate with this one, which is saved in your web browser configuration. Afterwards you are prompted to verify the certificate only when it is changed.

**Note:** Per default there is a self-signed certificate installed on the LANTIME which is not signed by a Certificate Authority (CA). Therefore some web browsers will state that the connection is not secure. If you want to install a certificate which was signed by a trusted Certificate Authority the “Upload SSL Certificate” button can be used. More details on this in the following instructions.

---

**Generate SSL Certificate:**
Allows to create a new self-signed SSL certificate.

**Show SSL Certificate:**
Review the currently installed SSL certificate.

**Download SSL Certificate:**
Allows to download the currently installed SSL certificate.

**Generate Certificate Request:**
Allows to generate a Certificate Signing Request (CSR) which can be sent to a Certificate Authority in order to apply for a signed certificate.

**Upload SSL Certificate:**
Allows to upload a certificate which was signed by a trusted Certificate Authority. This certificate must be in PEM file format, it must contain a private key and the certificate itself.

The content of the private key starts with
“——BEGIN RSA PRIVATE KEY——”
and ends with
“——END RSA PRIVATE KEY——”

the certificate itself starts with
“——BEGIN CERTIFICATE——”
and ends with
“——END CERTIFICATE——”.
This example is an excerpt from a PEM file:

```plaintext
---BEGIN RSA PRIVATE KEY---
MIICXQIBAAKBgQC6FkGxyJ6+Bqxzf3bNhEYyiRIAbQAIshb1YFG7aQk+8XbIXWB...
...a1Lbmu7N3TEDwVDgro8kMuQC/Ugktx7TJbqJoVsF5
---END RSA PRIVATE KEY---
---BEGIN CERTIFICATE---
MIIEJTCCA46gAwIBAgIJANF4dlCI2saDMA0GCSqGSIb3DQEBQUAMIG+MQswCQYD...
...ekZ970dAaPca
---END CERTIFICATE---
```

**IMPORTANT:** The certificate should not be protected with a password, otherwise the web server cannot start automatically.

### 9.1.4.3 Uploading certified Multi-Level / chained Certificates

Steps below require an SSH access to your time server.

In addition to SSL certificates, also multi-level / chained certificates are supported. In this case, a private key and a certificate chain are divided into two files, which are both in a PEM format. The actual PEM file contains the private key which is enclosed between BEGIN RSA PRIVATE KEY and END RSA PRIVATE KEY line as shown above. The CA-file on the other hand contains the certificate chain, where each single certificate is enclosed between BEGIN and END CERTIFICATE line as shown above.

The PEM file that contains the private key should be copied manually to `~/etc/https.pem` and the CA to `~/etc/https_cert.pem`.

Subsequently, the line `ssl.ca-file = "~/etc/https_cert.pem"` should be added in a server configuration file `~/etc/httpsd.conf`.

Running the command `saveconfig` saves the settings persistently, the command `restart https` applies the settings.

**Please Note:** The certificates should not be protected with a password, otherwise the web server cannot start automatically.
9.1.4.4 SNMP

The Simple Network Management Protocol (SNMP) is used in network management systems to monitor status of devices. SNMP works by querying "Objects". An object is simply something that we can gather information about a network device. The so called management information base (MIB) is a file which contains all objects that can be managed through SNMP.

The Meinberg SNMP MIB Files can be downloaded on the "System" page → Services and Functions → Download SNMP MIB. The files named "MBG-SNM P-ROOT-MIB.mib" and "MBG-LANTIME-NG-MIB.mib" need to be used to monitor a LANTIME V6 system.

(see also configuration chapter "Web GUI → System → Services and Functions")

By default the SNMP service is not activated on a LANTIME V6 system. The service can be activated on each interface at the "Network page → Network Services".

(see also configuration chapter "Web GUI → Network → Network Services")

The different SNMP configuration parameters are described below:

Activated Protocol Versions:
Configuration of the SNMP protocol version. The following options can be selected: 'V1/V2 only', 'V3 only', 'V1/V2/V3'.
V1/V2 Parameter

Read Community:
The read community is only used for SNMP versions V1 and V2. It is like a user id or password that allows access to the LANTIME SNMP objects. The SNMP Monitoring system sends the read community string along with all SNMP requests. If the community string is correct, the LANTIME responds with the requested information. If the community string is incorrect, the LANTIME simply discards the request and does not respond.

Write Community:
The write community is only used for SNMP versions V1 and V2. It is like a user id or password that allows access to the LANTIME SNMP objects. The SNMP Monitoring system sends the write community string along with all SNMP-SET commands. If the community string is correct, the SNMP-SET command is executed. If the community string is incorrect, the SNMP-SET command is not executed.

V3 Parameter

Security Name:
SNMP V3 User name

Security Level:
Messages can be sent unauthenticated, authenticated, or authenticated and encrypted by setting the Security Level to use:

- noAuthnoPriv – unauthenticated and unencrypted
- authNoPriv – authenticated and unencrypted
- authPriv – authenticated and encrypted

Engine ID:
Within an administrative domain, a SNMP V3 Engine ID is an unique identifier of an SNMP engine. A string with a maximum of 27 characters can be entered here. The string is used to generate the hex engineID by using the text format scheme described in RFC3411. If for example the string "hello" is configured as engineID, the generated hex engineID would be 800015dd0468656c6c6f

- 15dd is the hexadecimal representation of the Meinberg enterprise ID 5597
- 04 is an indicator that the text format scheme is used to generate the engine ID
- 68656c6c6f is the hexadecimal representation of the string "hello"

<table>
<thead>
<tr>
<th>Security Name</th>
<th>Security Level</th>
<th>Rights</th>
</tr>
</thead>
<tbody>
<tr>
<td>fo0</td>
<td>noAuthnoPriv</td>
<td>Readonly Access</td>
</tr>
<tr>
<td>hello</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Rights:
Configuration of the access level (Read access or Read/Write access).

Authentication Protocol:
The protocols used for Authentication are MD5 and SHA (Secure Hash Algorithm).

Authentication-Passphrase:
User passphrase that must be at least 8 characters in length.

Privacy Protocol:
The protocols used for Encryption are DES (Data Encryption Standard) and AES (Advanced Encryption Standard).

Privacy Passphrase:
A passphrase which is used when encrypting packets. It must be at least 8 characters in length.
9.1.4.5 SHS Configuration

SHS is the abbreviation for Secure Hybrid System and is available on LANTIME systems with two reference clocks. When the SHS mode is enabled only the currently active clock is used for passing the timing signal on to the NTP service, the other clock is indicated as "no select" and used only for measuring and comparing a time difference between both receivers.

In this respect SHS is different from a redundant mode. In redundant mode a switching unit switches between one or the other clock, depending on its availability and sync status and the active clock passes the timing signal on the NTP service.

SHS mode takes care for a secure operation and it steps into action when a time difference between both receivers exceeds a configurable time limit.

When this happens the alarms will be triggered and send out via configured notification channels (e.g. SNMP trap, email, syslog message). Besides, the NTP should be stopped in this case too to support the secure operation of the timing service, therefore you have to select “Stop NTP Service on Time Limit Error” at this step.

On the other hand, in IMS Systems with two reference clocks the timing signal coming from the clocks is continuously measured with a RSC card (Redundant Switch Control unit) and compared against each other. The measurements are forwarded to the SHS mode if this is enabled. Similar as in LANTIME systems with SHS, the alarms can be triggered when a difference of the two signals exceeds the configured time limit settings and the NTP service should be configured to stop.

![SHS Configuration](image)

**SHS-Mode**

The SHS mode can be selectively enabled or disabled via this selection box. If the SHS mode is disabled, no time comparison takes place and the times of both receivers are transferred directly to the NTP service. The NTP service then decides autonomously which time is used for synchronization (redundant mode).

**Time Limit Warning Level**

If the calculated time difference between the two reference clocks exceeds the configured value, the LANTIME generates a “SHS Time Limit Warning” alarm. This alarm can be sent via e-mail or SNMP Trap, if it is configured correspondingly in the Notification settings.

(see also configuration chapter "Web GUI → Notification → Email Information")

In LANTIME IMS systems with a built-in RSC, the parameter is configured in nanoseconds. For systems without an RSC in milliseconds.

**Time Limit Error Level (ms)**

If the calculated time difference between the two reference clocks exceeds the configured value, the LANTIME generates a “SHS Time Limit Warning” alarm. This alarm can be sent via e-mail or SNMP Trap, if it is configured correspondingly in the Notification settings.

In LANTIME IMS systems with a built-in RSC, the parameter is configured in nanoseconds. For systems without an RSC in milliseconds.
Stop NTP Service on Time Limit Error
Here you can decide if the NTP service is to be terminated at the Critical "TimeLimitError". In this case, requesting NTP clients would no longer receive a response from the time server.
9.1.5 NTP

The NTP configuration page is used to set up the additional NTP parameters needed for a more specific configuration of the NTP subsystem.

9.1.5.1 General Settings

Stratum Level when Unsynchronized
The stratum value for NTP refers to a distance away from a reference source and not the accuracy. For example, a time server with an internal reference such as GPS or DCF77, internally has a Stratum 0 and is considered from an external network as Stratum 1. The setting “Stratum Level when Unsynchronized” is used to configure the stratum value, by which the server presents itself in the network, when a reference time source is not available. This value does not take an effect until the configured NTP Trustime for the internal reference clock has expired and no further time sources such as external NTP servers are available.

Disable Stratum Changes
By activating this operation mode, the server always presents itself (even if asynchronous) as a Stratum 1 server in the network. The “Stratum Level When Unsynchronized” setting will become ineffective.
Examples:

a) A LANTIME, which is synchronized by its internal reference clock such as GPS or DCF77, acts as a Stratum 1 NTP server. If the "Disable Stratum Change" function is activated, the NTP server will act as Stratum 1 server, if the reference clock goes asynchronous and no other time sources are available.

b) A LANTIME, which is only synchronized by an external NTP server with Stratum 3, acts in a network as Stratum 4 NTP server. If the "Disable Stratum Change" function is activated, the NTP server will still act as Stratum 4 NTP server, even if the connection to the external NTP server is lost.

c) If NTP of the LANTIME with activated "Disable Stratum Change" function, changes from its internal reference clock to an external NTP server with Stratum 2, the Stratum of the LANTIME will change from 1 to 3.

NTP Trustime

This setting defines for how long NTP should "trust" the internal reference clock of a server after this has become asynchronous. The status of an asynchronous reference clock is also called "free running". The accuracy of a "free running" reference clock depends on the type of the integrated oscillator. The trust time should therefore be set dependent on the accuracy of the "free running" reference clock.

Figure: relation between holdover time (x) and offset (y) by using of built-in Meinberg oscillators
How do I configure the correct Trusttime in my application environment?
As an example, we now assume that our receiver has a built-in TCXO oscillator. The Trusttime should run out from an offset of 1ms. The graphic shows that this offset is reached after 10 hours of holdover time. Therefore a Trusttime of 10 hours should be configured.

Procedure: First you should find out which oscillator is used. Go to the web interface menu "Monitoring and Management → Clock → Receiver Information → Oscillator Type". Then you can define an offset, from which the NTP should lose its stratum or the trust time.

A list of oscillators available for Meinberg reference clocks:
https://www.meinbergglobal.com/english/specs/gpsopt.htm

Local Trusted Keys
In this field, you can enter the IDs of the symmetric keys which shall be used for the authentication. If you have more than one key, the IDs need to be entered with a space to separate them from one another. You can configure the symmetric keys in the submenu "NTP Symmetric Keys" on the NTP page. See "NTP Symmetric Keys" sub chapter for more information.
9.1.5.2 External NTP Server

Via the configuration page you can enter up to 7 external NTP server as backup for the internal reference clock.

Server Address:
IP or Hostname of an external Server.

Symmetric Keys:
In this optional field, you can enter the ID of a symmetric key, which is to be used for authentication with the external server.

To carry out with the authentication, we must pay attention to the following:

a) The NTP key file of the server must contain the ID. You can edit the key file in the submenu "NTP → NTP Symmetric Keys" on the NTP page.

b) Additionally you must enter the ID into the field "Trustable Keys" under "NTP → General Settings".

c) The same key with the same ID must be configured on the external server.

All external NTP server will be requested one by one using the originally ntpdate with only one server at a time. So it is possible to use symmetric keys for all servers which has to be defined in the standard ntp.keys file.

Older LTOS firmware version supports only one key for all external NTP servers. Additionally all external NTP servers will be added to ntp.conf as "noselect" - so NTPD can not select them as server but the current status of all servers can be shown via the NTP-Status also on the Web interface. The current selected server for the MRS/NTP reference will be marked with bold letters (see Web interface → Statistics/NTP Status).

There are two files from command line available: /xmr_info will show a detailed status of all servers. The current selected server is marked with a "*" and other servers could be marked as an outlier with "-".

List of the external NTP servers:

```
Id0: 172.27.100.32 is_accepted=1 has_auth=0 precision=-18 stratum=01 leap=00 trust=00 offset=+0.000008
delay=0.025770 root Dispersion=0.000137 group_id=0
Selected Server Id0: 172.27.100.32 with offset 0.000008 (updated at 20191010/10:40:38/UTC)
```
The selection algorithm for the best external NTP server is separated in the following steps:
- select which server is accepted
- decide if using servers with leap=11
- create groups of different offsets
- select the biggest group
- check for outliers and remove them from that group
- use the median as best-server
- check if last_best_external_NTP_server can be used – to reduce clock hopping

**Minpoll and Maxpoll:**
With these settings, you can set the minimum and maximum polling interval (query cycle) for a given external server. NTP starts with the minimum polling interval and changes step by step to the maximum of the polling interval.

**Use Iburst:**
The iburst activation accelerates the initial synchronization with an external server.
Particularity LANTIME/MRS:
With an MRS, the external NTP servers are not written into the NTP configuration of the server. They are queried internally every 32 seconds with the help of an "ntpdate" command. The determined time offset to the internal reference is filtered and sent to the MRS unit.

Due to this particularity, the configuration possibilities for external NTP server are different. The parameters Minpoll, Maxpoll and Iburst cannot be configured on a LANTIME/MRS. Regarding the authentication only a symmetric key which is used for all configured external servers, can be configured. It is not possible to use different keys for individual servers.

For a LANTIME/MRS you can adjust the default polling interval of 32 seconds via the manual configuration of the server. To proceed follow this menu navigation:

Web Interface - "System Page → Services and Functions → Manual Configuration → Standard Configuration → Miscellaneous Configuration"

You can use the parameter "MRS NTP POLL INTERVAL" to adjust the polling interval of the external server. As per default this value is set to 0, which means that external are queried every 32 seconds. Values can be set between 1 and 10 and are used as a power of 2. For example if this value is set to 6, this is equal to \(2^6 = 64\) seconds for a polling interval.

Use the parameter „MRS NUM NTP PACKETS PER POLL“ to set the number of NTP queries sent per polling interval. Per default this value is set to 0, which means that 4 packets are sent in a given polling interval. Set a value between 1 and 8, which corresponds to the actual number of packets.
9.1.5.3 Broadcast Settings

If the NTP time should be distributed in Broadcast mode in a local network, you can enter a valid broadcast address into this menu. Please note: starting with NTP4 version, the broadcast mode must always be used with authentication.

**Broadcast Address:**
A valid broadcast address of a local network, to which the LANTIME is connected must be entered here.

**Broadcast Interval:**
The interval at which the server sends the NTP packets to the configured broadcast address.

**Symmetric Keys:**
In this field you can enter the ID of a symmetric key, which is to be used for authentication with the NTP clients.

The following must be respected, to make the authentication work:

a) The NTP key file of the server must contain the ID. You can edit the key file in the submenu "NTP → NTP Symmetric Keys" on the NTP page.

b) Additionally you must enter the ID into the field "Trustable Keys" under "NTP → General Settings".

c) The same key with the same ID must be configured on the NTP client.

The following is an excerpt from the NTP configuration of a client, which is configured as a broadcast client with authentication:

```bash
keys /etc/ntp.key # Path to the NTP Key File
ttrustedkey 1 # The Key ID, which is used for the authentication
broadcastclient # This client works as a broadcast client
```
9.1.5.4 NTP Multicast and Manycast

NTP Multicast offers the possibility to distribute the time by multicast in the network. The Internet Assigned Numbers Authority (IANA) has exclusively allocated the multicast IP address 224.0.1.1 for NTP. Therefore, it is recommended to use this address as a multicast address. However, also other addresses of the multicast address space can be set.

The multicast address space is as follows:

| IPv4: 224.0.0.0 -> 239.255.255.255 |
| IPv6: Every FF00::/8 Address |

**Multicast Address:** A correct multicast address must be entered here.

**Broadcast Interval:** The interval at which the server sends the NTP packets to the configured broadcast address.

**TTL:** The configured TimeToLive (TTL) value determines how many hops NTP packets can pass in the network. Each network hop reduces this value by 1. When the value reaches zero, the network packet is dropped.

**Symmetric Keys:** For NTP Multicast, an authentication is recommended, but not mandatory. However, if the authentication is configured on the server side, it is also necessary to do so on the client side.

In the field “Symmetric Keys” you can therefore enter the ID of a symmetric key, which is to be used for authentication with the NTP clients.

The following must be respected, to make the authentication work:

a) The NTP key file of the server must contain the ID. You can edit the key file in the submenu "NTP → NTP Symmetric Keys" on the NTP page.

b) Additionally you must enter the ID into the field "Trustable Keys" under "NTP → General Settings".

c) The same key with the same ID must be configured on the NTP client.
The following is an excerpt from the NTP configuration of a client, which is configured as a multicast client with authentication:

```
keys /etc/ntp.key
trustedkey 1
multicastclient 224.0.1.1 key 1
```

# Path to the NPT Key file
# The Key ID, which is used for the authentication
# The Client listens on the Multicast Address 224.0.1.1 and uses the key with ID 1 for authentication

## 9.1.5.6 NTP Manycast

NTP Manycast describes the possibility that one or more NTP servers are behind a multicast address. However, contrary to the multicast method, the servers do not send NTP packets periodically to this multicast IP. The Manycast feature is much more a method to automatically reconfigure the NTP service of a requesting client. The NTP service of the client selects up to 3 servers automatically, which seem to be ‘best’ for him. The NTP service then reconfigures itself independently, and establishes a unicast communication with these servers. As with multicasting, it is recommended to use authentication methods.

### Enable Manycast:
It activates the Manycast-Feature

### Manycast Address:
Address field for entering the manycast address (multicast address space)

The Multicast Address Range is as follows:

<table>
<thead>
<tr>
<th>IPv4:</th>
<th>224.0.0.0 -&gt; 239.255.255.255</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6:</td>
<td>Every FF00::/8 Address</td>
</tr>
</tbody>
</table>

### Symmetric Keys:
For NTP Manycast, a key method for authentication is recommended, but not mandatory. However, if the authentication method is configured on the server side, it is necessary to do so on the client side.

In the field “Symmetric Keys” you can therefore enter the ID of a symmetric key, which is to be used for authentication with the NTP clients.

The following must be respected, to make the authentication work:

a) The NTP key file of the server must contain the ID. You can edit the key file in the submenu "NTP → NTP Symmetric Keys" on the NTP page.

b) Additionally you must enter the ID into the field "Trustable Keys" under "NTP → General Settings".

c) The same key with the same ID must be configured on the NTP client.
keys /etc/ntp.key
trustedkey 1
manycastclient 224.0.1.2 key 1

# Path to the NPT Key file
# The Key ID, which is used for the authentication
# The Client listens on the Multicast Address 224.0.1.2 and
# uses the key with ID 1 for authentication
9.1.5.7 NTP Symmetric Keys

Since NTP version 3, NTP has been providing an authentication method using symmetric keys. The "NTP Edit Key" button can be used to edit the NTP key file of the server. Upon delivery of the server, the file contains a sample key. The "Automatically Generate Keys" button allows MD5 keys and SHA1 keys to be generated automatically.

The following is an representative excerpt from an NTP key file:

```
1 M f294fa0 # MD5 key
2 MD5 BtdW/<gj2*2M;!'˜qAIN # MD5 key
3 SHA1 094c533b614d9e4bcb6e18a97a7b0e4d459025bd # SHA1 key
```

The first column contains a unique key ID (value range 1 - 65535). The second column contains the key type ("M" or "MD5" for an MD5 key, or "SHA1" for a SHA1 key). The third column contains the key string, which may be between 1 and 32 characters long.

**How do I set up authentication between a LANTIME and my NTP clients?**

1. Add the keys which are to be used to the key file of the server. The following is a representative excerpt from the key file of a server:

```
1 M f294fa0 # MD5 key
2 MD5 BtdW/<gj2*2M;!'˜qAIN # MD5 key
3 SHA1 094c533b614d9e4bcb6e18a97a7b0e4d459025bd # SHA1 key
```

2. Enter the IDs of these keys into the "Trusted Keys" field under "NTP → General Settings", for example:

```
Vertrauenswürdige Schlüssel
123
```

3. The following is a sample excerpt from the NTP configuration of a Linux client which uses the key with the ID 2 for authentication with the server 192.168.100.1 and the key with the ID 3 for authentication with the server 192.168.100.2:

```
keys /etc/ntp.keys # path to keys file
trustedkey 2 3 # IDs of keys to be trusted
server 192.168.100.1 iburst minpoll 6 maxpoll 6 key 2
server 192.168.100.2 iburst minpoll 6 maxpoll 6 key 3
```

In this case, the key file of the client must contain the keys with the IDs 2 and 3, which must be identical to the keys of the server.
9.1.5.8 NTP Configuration

The current NTP configuration file is displayed via the 'Show current NTP configuration' button. This file is automatically generated by the system at every restart or change of the NTP configuration and cannot be edited directly.

If additional settings are required for NTP (Authentication, Restriction ...), which are not covered with the existing settings on the NTP page, an additional configuration file must be used. This file can be edited and managed using the "Edit Additional NTP Parameters" button. Every time the 'ntp.conf' is created this additional file is automatically attached to it.

9.1.5.9 NTP Restrictions

The "NTP Restrictions" page can be used to restrict NTP access to specific IP addresses.

For example, to allow access for all addresses from the subnet 192.168.100.x, enter 192.168.100.0 under IP Address and 255.255.255.0 under Netmask. Access can also be allowed for individual IP addresses.

In order to enable the restricted access, the 'Activate Access Restriction' option must be activated here. Client IP addresses, which are not covered in the allowed IP address ranges, will no more receive NTP responses from the LANTIME.

Ignore NTP Mode 6 and 7 Packets
This setting cause that internal information, like Access statistics, cannot be queried by other NTP able devices in the network, via the NTP service of the server. The setting does not have any effect on the time synchronization between NTP clients and the server.

Activate access restriction
By activating this setting the following lines will be written into the NTP configuration of the Server:

```
restrict default noserve
restrict -6 default noserve
restrict 127.0.0.1
restrict -6 ::1
```

These settings cause that the server no longer responds to NTP requests. In the submenu 'Configure NTP Restrictions' you can configure a "white list" of client IP addresses or even entire subnets whose requests are allowed to be answered by the server.
9.1.5.10 NTP Leap Second Handling

The time base for mostly all the world's local time zones is called Coordinated Universal Time, UTC, which is derived from several atomic clocks which are distributed in different countries all over the world. The rotation of the earth is not constant and varies over time, while the mean earth rotation speed is decreasing slowly. This is the reason why so called leap seconds are inserted into the UTC time scale, which compensate the UTC time with the real earth rotation. A leap second is always inserted at 23:59:59 (UTC), either on 31.12. or 30.06. (Other dates are theoretically possible, but practically have not been used yet).

Some protocols or methods for transferring the time information, e.g. GPS, NTP, PTP, DCF77 and IRIG can pre-announce leap seconds to give a receiver the opportunity to prepare for a leap second in advance. The GPS satellite system distributes the leap second announcement six months before the leap second event. Meinberg LANTIMEs with GPS receivers receive this announcement automatically via the GPS signal. In the log file of the LANTIME, the entry "Leap Second Announced" is generated when the date of the leap second is received.

Other synchronization methods do not offer this announcement possibility, which can lead to a one second time jump. Therefore, it is necessary to keep the NTP leap second file up-to-date on these systems, so that a leap second is correctly inserted at the midnight (UTC).

In the menu "NTP Leap Second Handling", you can view the currently stored leap second file, you can manually upload the file or configure an automatic download from the following source pages:

Available Download Sources for Leap Second Files:

1. NIST Leap Second File:
   ftp://time.nist.gov/pub/ (directory listing)
   ftp://time.nist.gov/pub/leap-seconds.list (current leap second file)

2. IERS (Earth Rotation and reference systems Service) Leap Second File:
   https://hpiers.obspm.fr/iers/bul/bulc/ntp/ (directory listing)
   https://hpiers.obspm.fr/iers/bul/bulc/ntp/leap-seconds.list (current leapseconds file)

3. Meinberg Leap Second File (Copy of the IERS Leap Second File):
   https://www.meinberg.de/download/ntp/leap-seconds.list
   https://www.meinberg.de/download/ntp/leap_second
9.1.5.11 Special Settings

**Time Scale**
This setting configures the time zone of the NTP. The default setting is "UTC", since NTP is based on UTC by default and standard NTP clients expect UTC time.

The setting "LOCAL TIME" should only be selected, if the time server is used to synchronize specific clients that require local time. If you select "LOCAL TIME" here, the exact time zone must be configured in the menu "System → Display".

**Attention:** The use of "LOCAL TIME" is a violation of the NTP standard and causes standard NTP clients to accept faulty time and to make a time jump accordingly.

**Fixed Offset (s)**
This value is used to manipulate the output time of the NTP service. The configured value in seconds is added to the current time and provides a possibility to spoof the NTP time if wanted.

**Attention:** The use of a "Fixed Offset" is a violation of the NTP standard and causes standard NTP clients to accept faulty time and to make a time jump accordingly.

**Max. Internal Offset (s)**
This value in milliseconds specifies a minimum accuracy the NTP service must reach, before the server starts to serve time to the clients. E.g. entering a value of 1ms means that the service will wait until the internal clock has reached 1ms accuracy or better.

**Pass-through MRS Stratum**
This feature only comes into effect if you synchronize a LANTIME with MRS feature primarily via NTP. If "Pass-through MRS Stratum" is not activated, the LANTIME presents itself as Stratum 1 server in the network. If "Pass-through MRS Stratum" is active, the stratum of the external NTP server is considered. For example, if the external server is a Stratum 1 server, the MRS LANTIME would appear as Stratum 2 server in the network.
9.1.6 PTP

All parameters for proper PTP functionality can be configured in a clear and user friendly Web GUI. The set of parameters which can be configured in the Web GUI corresponds to the PTP card version currently installed in the system. Some features are available with TSU-GbE cards and above only and these are marked as optional (*) in this manual.

When you log in to the Web GUI, please follow to the PTP dialog. In the main menu the following sub-menus are listed:

- PTP Status
- PTP Configuration

If more than one PTP unit (PTP ports) is built into the system, then the status and configuration for each port can be edited separately and will be listed on this page.

9.1.6.1 PTP Status Information

The PTPv2 status dialogue shows all current status information of the selected PTP card according to its settings configured in the configuration submenu.

9.1.6.2 PTP Network Status

In the Network tab you can check if network settings of the PTP card are valid.

Local MAC Address of the PTP unit

If the PTP card operates currently as a Grandmaster (GM) its local MAC Address is shown in the status of PTP slaves which are currently synchronized to this GM.
UUID
The UUID is the unique identifier of the PTP port which is based on the MAC address of the PTP port.

9.1.6.3 PTP Global Status
In the Global submenu the current operation mode of the selected PTP port (interface) is shown. The appearance of this page depends on the mode of the PTP card operation. Different states of a PTP port are possible. For example, if the unit is configured as a PTP master clock, then this page shows ‘Master’ state. In MRS (Multi Reference Source) devices, the PTP mode ‘Slave’ may be displayed here.

Port States

Uninitialized - The PTP module is booting up, the software daemon has not yet started, the IP address is not yet assigned.

Initializing - In this state the port initializes its data sets, hardware, and communication facilities.

Faulty - Not defined in LANTIME systems.

Stopped - The PTP service has been stopped or it has not started due to a missing link on the PTP port or a not-synchronized master clock after a startup.

Disabled - Not defined in LANTIME systems.

Listening - The port is waiting for the announceReceiptTimeout to expire or to receive an Announce message from a master.

preMaster - A short transitional state while the port is becoming a master.

Master - The port is a current master.

Passive - The port is in passive mode, meaning there is another master clock active in the PTP domain. The port can enter master state when it wins the BMCA (Best Master Clock Algorithm) due to a failure/service degradation of the current master.

Uncalibrated - The port wants to become a slave in the PTP domain and has already detected a suitable grandmaster. The TSU is waiting to calculate the path delay to a Grandmaster.

Slave - The port has successfully subscribed to a master and receives all expected messages. It also successfully measured the path delay using delay request messages.

Grandmaster MAC - The MAC Address of the current Grandmaster.
Clock Accuracy  The clock accuracy of the active grandmaster. This value is used in the Best Master Clock Algorithm to select the best master.

PTP Seconds  Current value of the raw PTP seconds value (seconds since 1970).

UTC Offset  This value represent the current Offset to the PTP time based on TAI to calculate UTC.

Domain Number  A PTP domain is a logical group of PTP devices within a physical network which is defined by the same domain number. Slave devices that should sync to a certain master in the network must be configured with a unique domain number which is the same as for the master.

Port Link up  Status 0: the port is down, check the link LED and the connection to the link partner. If faulty, the network card should be replaced.

Status 1: the port is in normal operation.

Delay Asymmetry  If a static asymmetry offset in the network is known, this value may be entered (in ns) to compensate it before the PTP start.

Clock Class  PTP Clock class of the currently selected PTP grandmaster. This value is used in the Best Master Clock Algorithm.

Time Source  The type of a time source as used by the Grandmaster (informative only).

Leap Second  Leap second announcement flag, set up to 24 hours prior the leap second event, depending on the GM implementation.

TSU Time  Displayed time of day in the selected PTP timescale.

9.1.6.4 SyncE Status

You can check if SyncE functionality is activated on the card or not (if supported by the PTP module).
9.1.6.5 Menu PTP Status Info

Under this menu item you will find information about the used PTP module, about the packets sent and received (Packet Counter) as well as information about active unicast connections.

9.1.6.6 Menu PTP Status Datasets

Clock Variance:
This a log scaled statistic which represents the jitter and wander of the clocks oscillator over a Sync message interval.
9.1.6.7 PTP Configuration Menu

All parameters for proper operation of each PTP port (interface) which are built into the system should be configured separately according to its function in the PTP network. Whenever a change should be applied, it needs to be saved by confirming the “Save Settings” button at the bottom of the page.

The configuration parameters are grouped in the submenus as follows. Submenus marked with * are available on HPS100 or TSU-GbE modules only (the tabs marked with ** only on HPS100).

- Network
- Global
- SyncE*
- Misc*
- Outputs*
- NTP** (Software NTP Service)
9.1.6.8 PTP Network Configuration

Monitor Interface

Monitoring of network port’s link status.
As soon as the selected PTP network connection no longer detects a link, this state triggers a “PTP Link Down” event. This event is displayed in the menu “Notification → Notification Events”.

If the PTP module is not required and is therefore not connected to the network, the checkbox “Monitor Interface” can be unchecked. No error event will be triggered then.
<table>

<td>Ipv6 Address assigned to the selected PTP port. If Static option is activated for IPv6 Mode, then a valid static IP address can be configured in this field.</td>
</tr>
<tr>
<td>IPv6 Multicast Scope</td>
<td>The prefix of IPv6 multicast addresses specifies their scope. A specific scope in case of multicast mode can be selected here.</td>
</tr>
<tr>
<td>Enable VLAN Option</td>
<td>Activation / deactivation of Virtual LAN (IEEE 802.1Q) service on the PTP interface.</td>
</tr>
<tr>
<td>VLAN-Tag (1-4094)</td>
<td>A 12-bit value specifying a VLAN ID to which a PTP port belongs.</td>
</tr>
<tr>
<td>Priority</td>
<td>Values 0 (default, lowest priority) to 7 (highest priority) which can be used to prioritize network traffic for different types of data.</td>
</tr>
<tr>
<td>Disable SSH Service</td>
<td>If checked then SSH Access for this PTP port is deactivated. This option is only available with a TSU-GbE module.</td>
</tr>
<tr>
<td>DCSP PTP Classification</td>
<td>Differentiated Services Code Point. This is a QoS parameter within the IP header of the Classification PTP packet to prioritize the traffic.</td>
</tr>
</tbody>
</table>
Multicast TTL  

Time-To-Live. By default, the PTP multicast traffic is not routed and this value is defined as "1" by the PTP standard. However, a user-defined configuration of the TTL value can be entered here to change the default value.
9.1.6.9 PTP Global Configuration

Operating Mode

PTP or NTP
If supported, it is possible to run an NTP service in server mode with hardware timestamp support. In this step, choose between PTP and NTP mode. It is not possible to run both modes simultaneously on one TSU card.

PTPv2 or PTPv1 (HPS100 - license PL-C/D/E)
The card can operate in PTPv1 mode to serve as a communication interface between PTPv1 and PTPv2 network elements.
**Monitor** (HPS100 - license PL-D/E)

To monitor PTP network elements and generate statistics, a HPS100 can operate in monitor mode. Only if this mode is activated, it is possible to monitor PTP-nodes in the network via the HPS100.
Select Profile
User can choose among preselected sets of PTP parameters defined in profiles usually used in different industries. If the default setting “Custom” is selected, the user can select any parameter combination available in the global configuration section as long as the PTP standard allows it. Depending on the selected profile, there might be profile specific parameters available which can be found in the “Profile Specific Parameters” section below the standard PTP parameters sections.

There are twelve different presets currently supported on PTP cards:

Please note: When you switch to another profile, your current settings are overwritten with the default values of the selected profile.

Example: When selecting the Telecom ITU-T G.8275.1 profile, SyncE is automatically activated and the GBit Link Copper mode in the the tab SyncE is set to “Automatic”.

In Unicast Master / Slave Mode:

Telecom ITU-T G.8265.1

- Ann Msg Rate: 1/sec
- Sync Msg Rate: 16/sec
- Del Req Rate: 16/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “E2E”
- Network Prot: “Layer 3 (UDP/IPv4,v6)"

Telecom ITU-T G.8275.2

- Ann Msg Rate: 8/sec
- Sync Msg Rate: 128/sec
- Del Req Rate: 128/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “E2E”
- Network Prot: “Layer 3 (UDP/IPv4,v6)"
In Unicast or Multicast Master / Slave Mode:

**Default E2E IEEE 1588-2008**
Default Profile with End-To-End Delay Mechanism as defined by the IEEE 1588-2008 standard, available in Multicast and Unicast mode.

- Ann Msg Rate: 2 sec
- Sync Msg Rate: 1/sec
- Del Req Rate: 1/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “E2E”
- Network Prot: “Layer 3 (UDP/IPv4,v6)”

**SMPTE ST 2059-2**

- Ann Msg Rate: 4/sec
- Sync Msg Rate: 8/sec
- Del Req Rate: 8/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “E2E” or “P2P”
- Network Prot: “Layer 3 (UDP/IPv4,v6) or Layer 2 (IEEE 802.3)”

**AES67 Media Profile**

- Ann Msg Rate: 1/sec
- Sync Msg Rate: 8/sec
- Del Req Rate: 8/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “E2E” or “P2P”
- Network Prot: “Layer 3 (UDP/IPv4)”
In Multicast Master / Slave Mode:

Default P2P IEEE 1588-2008
Default Profile with P2P delay mechanism as defined by the IEEE 1588-2008 standard, available in Multicast mode.

- Ann Msg Rate: 2 sec
- Sync Msg Rate: 1/sec
- Del Req Rate: 1/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “P2P”
- Network Prot: “Layer 3 (UDP/IPv4,v6) or Layer 2 (IEEE 802.3)”

Telecom ITU-T G.8275.1

- Ann Msg Rate: 8/sec
- Sync Msg Rate: 16/sec
- Del Req Rate: 16/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “E2E”
- Network Prot: “Layer 2 (IEEE 802.3)”

Power IEEE C37.238-2011

- Ann Msg Rate: 1/sec
- Sync Msg Rate: 1/sec
- Del Req Rate: 1/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: “P2P”
- Network Prot: “Layer 2 (IEEE 802.3)”
- VLAN (802.1Q): enabled (VLAN ID:0, Prio:4)
- Power Profile: TLVs enabled
Power IEEE C37.238-2017

- Ann Msg Rate: 1/sec
- Sync Msg Rate: 1/sec
- Del Req Rate: 1/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "P2P or E2E"
- Network Prot: "Layer 3 (UDP/IPv4,v6) or Layer 2 (IEEE 802.3)"
- Power Profile: TLVs enabled

Utility IEC 61850-9-3

- Ann Msg Rate: 1/sec
- Sync Msg Rate: 1/sec
- Del Req Rate: 1/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "P2P"
- Network Prot: "Layer 2 (IEEE 802.3)"
- Power Profile: TLVs enabled

IEEE 802.1AS

- Ann Msg Rate: 1/sec
- Sync Msg Rate: 8/sec
- Del Req Rate: 1/sec
- Priority 1: 248
- Priority 2: 248
- Delay Mech: "P2P"
- Network Prot: "Layer 2 (IEEE 802.3)"

DOCSIS 3.1

- Ann Msg Rate: 8/sec
- Sync Msg Rate: 16/sec
- Del Req Rate: 16/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "E2E"
- Network Prot: "Layer 2 (IEEE 802.3)"
PTP Mode:
A PTP port can operate in one mode only: master or slave. When the mode is selected the user can choose between multicast or unicast-only protocol. In the newest firmware a combined unicast multicast master mode of operation is also supported.

Hybrid-Mode:
In this mode PTP messages Sync, FollowUp and Announce are sent in Multicast whereas the DelayRequest and DelayResponse Messages are sent in Unicast.

Delay Mechanism:
Two options possible:
E2E (End-to-end) where delay measurement messages are sent directly from a slave to the master (two end nodes).

P2P (Peer-to-peer): each device (a peer) in the network exchanges peer-delay measurement messages. This way each node can keep a track of the delays between itself and its immediately connected neighbour. P2P mechanism can be used in 1588 PTP-capable networks only.

Domain Number:
A PTP domain is a logical group of PTP devices within a physical network which is defined by the same domain number. Slave devices that should sync to a certain master in the network must be configured with a unique domain number which is the same as for the master.

Network Protocol:
Three options for network protocol are possible:
ETH-IEEE 802.3 / Ethernet (Layer 2): Ethernet frames including MAC addresses of a slave and master.
UDP/IPv4 or UDP/IPv6 (Layer 3): User Data Protocol one of the main protocols used for the Internet.

Timescale:
Two options are possible:
PTP: As per default TAI timescale is used in PTP timing. TAI is a linear timescale without discontinuities such as inserted leap seconds in the UTC timescale. A time unit is based on SI second. The TAI timescale started with 1 January 1970 00:00:00.

Arbitrary: In normal operation, the epoch is set by an administrative procedure.

Priority 1:
The attribute is used in the execution of the best master clock algorithm (BMCA). Lower values take precedence.
Configurable range: 0...255. The operation of the BMCA selects clocks from a set with a lower value of priority1 over clocks from a set with a greater value of priority1.

Priority 2:
The attribute is used in the execution of the BMCA. Lower values take precedence.
Configurable range: 0...255.
In the event that the operation of the BMCA fails to order the clocks based on the values of priority1, clockClass, clockAccuracy and scaledOffsetLogVariance, the priority2 attribute allows the creation of up to 256 priorities to be evaluated before the tiebreaker. The tiebreaker is based on the clockIdentity. The values clockClass, clockAccuracy and scaledOffsetLogVariance depend on the internal state of the grandmaster and cannot be configured.

Msg. Intervals:
Specify the settings for PTP message rates.

Announce Interval:
Specifies the rate for sending announce messages between masters in order to select the current Grand Master.
Available settings are: 16/s, 8/s, 4/s ... 2s, 4s, 8s, 16s with a default value 2 seconds.

Sync Interval:
Specifies the rate for sending sync messages from a master to slave.
Available settings are: 128/s, 64/s ... 64s, 128s, with a default value 1 second.

Delay Request Interval
Specifies the rate how often delay request messages are sent from a slave to the master. Delay request messages intervals 128/s, 64/s … 64s, 128s, with a default value 2 seconds.

**Interval Duration [s]:**
Requested duration until timeout / renewal.

**Announce Receipt Timeout:**
Specifies the rate for announce receipt timeout messages which is generally 2-10 times the Announce Interval rate, with a default value of 3. In this time the BMCA procedure should select the current Grandmaster.

**Alternate Time Offset Indicator Extension:**
The Alternate Time Offset Indicator (ATOI) TLV extension is used to transmit local time information, such as local time zone offset and summer time changeover, from master to slave devices. This TLV has a current offset data field and can therefore provide the data required to convert TAI- or UTC-based time information to local time.

**Profilspezifische Einstellungen**

**Use Profile Extensions**

**Grandmaster ID**
9.1.6.10 Option SyncE Configuration

This submenu allows all relevant settings for the Synchronous Ethernet functionality. SyncE is an ITU-T standard for computer networking that facilitates the transference of clock signals over the Ethernet physical layer.

**Note:**
The SyncE signal can only be used as a reference input signal, when a TSU-GbE card operates in an MRI Slot (see menu – “Configuration Receiver → MRS Settings”).

**Enable SyncE**  
Activation / Deactivation if SyncE signal on a PTP port. SyncE runs on the PHY network layer therefore it does not disturb PTP on Layer 2 or Layer 3. They both can run in parallel on the same port.

**Quality Level Selection**  
If enabled, the Quality Level is transported once per second within the ESMC (Ethernet Synchronization Message channel) and are determined automatically depending on the clock status in master mode or used as they are received as an input in slave mode. If this mode is disabled, then the settings chosen below in Fixed Input SSM and Fixed Output SSM are used permanently as static values.

**SDH Network Option**  
The selected values for the Quality levels depend on the SDH network options which reflect to Option 1 (for SDH, E1 based systems) or Option 2 (for SONET, T1 based systems).

**Fixed Input SSM** Fixed Quality level of the SyncE input signal.  
**Fixed Output SSM** Fixed Quality level of the SyncE output signal.

**Gbit Link Copper Mode**  
If the copper mode is used for SyncE in Gbit mode then the Clock Master or Clock Slave needs to be defined. This is not necessary if optical connections via SFP are used as this is determined automatically there.

**Mode**  
User can select if the copper port should be forced to act as the clock master or clock slave depending on the role (Master/Slave) that this SyncE port should have. Misconfiguration can lead to link loss, so the user needs to take care about the proper configuration of the link partners.

**Port**  
The port can operate in a SyncE clock master or clock slave mode. A configuration is only necessary for the copper port but not for Fibre Optic connections.
9.1.6.11 Misc. Configuration

Activate PTP One Step:
Per default Two Step approach is active.

Two Step approach: The PTP protocol requires the master to periodically send SYNC messages to slave devices. The hardware time stamping approach of PTP requires that the master records the exact time when such a SYNC packet is going on the network wire and needs to communicate this time stamp to the slaves. This can be achieved by sending this time stamp in a separate packet (a so-called FOLLOW-UP message).

One Step operation enabled: the SYNC messages itself is time stamped on-the-fly just before it leaves the network port. Therefore, not FOLLOW-UP message is needed.

Disable PTP
A protocol within PTP use to query and update the PTP data sets maintained by master clocks. These messages are also used to customize a PTP system and for initialization and fault management. Management messages are used between management nodes and clocks. This feature is enabled per default.
9.1.6.12 Option: Output Configuration

TSU-GbE card comprises one Gigabit Ethernet SFP/RJ45 Combo Port for network synchronization and two female BNC output interfaces with a list of available signals as follows:

- PPS (generated locally on the TSU)
- 10 MHz (generated locally on the TSU)
- 2048 kHz (taken from active internal clock module)
- 10 MHz (taken from active internal clock module)
- PPS (taken from active internal clock module)

Per default no output signal is active on both outputs.
9.1.6.13 Configuration NTP

Software NTP Daemon
This feature is only supported by PTP modules of type HPS100 with HPS firmware version $\geq 1.4.1$. The type and firmware version of a built-in PTP module can be checked under "PTP → PTPv2 Status → Info".

Enable Software NTP Daemon:
If activated, a Software NTP Deamon is also started on the PTP module. This service works in the same way as the NTP software service on the LAN-CPU and can be parameterized accordingly. The Software NTP Deamon can be used in parallel with all other operating modes of the PTP module that can be set in the "Global" tab. Symmetric keys configured on the main system under "NTP → NTP Symmetric Keys" are automatically included in the NTP configuration of the PTP module. If the PTP module has been configured as an NTP server in the "Global" tab, all NTP requests without symmetric key authentication will continue to be answered by the hardware NTP responder of the PTP module. NTP requests with symmetric key authentication are answered by the Software NTP Deamon.

Display NTP configuration:
This button can be used to display the current NTP configuration. The initial configuration is generated automatically when the Software NTP Deamon is activated.

Editing Additional NTP Parameters:
This button can be used to configure additional NTP parameters, such as Restrictions or Trusted Keys. The syntax must follow the standard configuration syntax of the ntpd. After saving, configured lines are automatically appended to the NTP configuration generated by the PTP module.
9.1.7 FDM - Frequency Deviation Monitoring

A preconnected reference is necessary to provide a serial time string, a PPS (pulse per second) signal and 10MHz frequency. The accuracy of the measurements is derived from these signals.

The module calculates the frequency as well as the time, based on the mains frequency. The time deviation (TD) is the difference of this calculated time (PLT) to the reference time (REF). This time deviation as well as the frequency itself is sent out via serial interface or is being converted to an analog voltage output provided by a DAC.
9.1.7.1 FDM Status

This menu shows the following values:

**Current Frequency:** the current frequency of the monitored power network

**Reference Time:** REF - the time of the reference clock (i.e. GPS)

**Power Line Time:** PLT - the time of the monitored power line

**Line Frequency:** mains frequency (50Hz or 60Hz)

**Flags:** transmitted Flags by FDM (Error Bits)

**Receiver State**

The “Receiver” tab displays all connected and configured receivers.
9.1.7.2 FDM Configuration

Automatic Monitoring of Powerline Frequency

It is possible to define an upper and lower limit for the powerline frequency and receive alarm messages (email, syslog, SNMP traps) when a LANTIME device detects that the frequency measurement value is outside the acceptable range.

With the FDM configuration menu the following parameters can be set:

**Line Frequency:** configure frequency of the observed power line

**Min Frequency:** an error occurs if the frequency reaches the min constraint

**Max Frequency:** an error occurs if the frequency reaches the max constraint

**Max Negative Time Deviation:** an error occurs if the frequency reaches the max negative constraint

**Max Positive Time Deviation:** an error occurs if the frequency reaches the max positive constraint

**Timezone:** used local timezone for reference time and powerline time

**Activate Logging:** activate logging for FDM in XtraStats

**Reset FDM** to restart the device
Configuration of serial ports

<table>
<thead>
<tr>
<th>Baud Rate</th>
<th>Framing</th>
<th>String Type</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>1200</td>
<td>8N1</td>
<td>FDM Standard, FDM Short, FDM Areva, FDM TPC, Fingrid, FDM Standard 2, FDM 3 and FDM Computime</td>
<td>per second</td>
</tr>
</tbody>
</table>

The standard FDM telegram format contains the following values:
- mains frequency (FF.xxx Hz)
- frequency deviation (+-FF.xxx Hz)
- reference time (HH:MM:SS)
- power line time (HH:MM:SS.mmm)
- time deviation (+-MM:SS.mmm)
Analog Outputs

The FDM180 provides two analog outputs (A0/A1) via the 16-pin X1 connector. These outputs have a voltage range of -2.5V .. + 2.5V, divided into 65,536 steps (16-bit resolution).

Either the frequency deviation or the difference time of each analog output can be selected as display-value.

Mode:

**Time Deviation:** Depends on the defined constraints for Min Time Deviation and Max Time Deviation

Example: min: -100s and max: +100s if the time deviation reach -100s the analog output is at -2.5 V and if +100s then at +2.5 V with a resolution of 16bit DAC

**Frequency Deviation:** Depends on the defined constraints for Min Frequency Deviation and Max Frequency Deviation

Example: min: 45Hz and max: 55Hz @ 50Hz line frequency if the frequency deviation reach 45Hz the analog output is at -2.5 V and if 55Hz then at +2.5V with a resolution of 16bit DAC
Submenu Set TDEV

![FDM Configuration](image)

**Time Deviation** set a value to preconfigure the time deviation 0 for reset (example: if you already had one FDM an get another one and want that both FDM have the same time deviation value).
Submenu New Receiver

In this section, the user can add a new receiver for FDM telegrams. Any number of receivers (network displays and/or PCs for analysis and display of status messages or frequencies), which are connected to the same network, can be configured here.

**Receiver Type**

- **Standard:** Standard FDM time telegram
  - Sent once per second
  - i.e. "F:50.016 FD:+00.016 REF:15:17:57 PLT:15:17:57.056 TD:+00.056"

- **Extended:** Extended FDM time telegram with intermediate measurements and sequence ID
  - Sent once per second
  - or "F:50.013 FD:+00.013 REF:15:19:10 PLT:15:19:10.071 TD:+00.071 SEQ:0000000004"

- **Intermediate:** Truncated FDM time telegram with intermediate measurements
  - Sent once per 100ms
  - M1:49.997 SEQ:0000000053
  - M2:49.996 SEQ:0000000054
  - M3:50.000 SEQ:0000000055
  - M4:49.999 SEQ:0000000056
  - M5:49.996 SEQ:0000000057
  - M6:49.996 SEQ:0000000058
  - M7:49.997 SEQ:0000000059
  - M8:49.995 SEQ:0000000060
  - M9:49.996 SEQ:0000000061
  - M9:49.996 SEQ:0000000062

- **Custom:** Customized FDM time telegram, which consists of prefix, string and suffix
  - Sent once per second

**Address:**

Address or host name of the message recipient (display or computer)

**Port:**

Used TCP/UDP port for telegram transmission

**Transport Protocol:**

Used protocol for telegram transmission (TCP/UDP)
Prefix: Prefix of customized strings, control characters can be specified by their hex value (ASCII), for example: "\x01" for SOH (Start of Header) or "\x02" for SOT (Start of Text)

String: Customized time telegram, which can be composed of arbitrary text and the following variables (identified by the prefix '%'):

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

An auto-toggle feature allows to define a sequence of formats by setting up comma-separated format strings. Additionally, the duration of a format string can be defined using the FORMATSTR@DURATION format.

The following example will show the Powerline Frequency for 20 seconds, then the Reference Time for 30 seconds, then the Frequency Deviation for 10 seconds. Afterwards, it will start over with the PLF display:

```
PLF %PLFRQ Hz@20,REF %REFTIME@30,FDV %FRQDEV@10
```

Suffix: Suffix of customized strings, control characters can be specified by their hex value (ASCII), for example: "\x0A" for LF (Line Feed) or "\x0D" for CR (Carriage Return)

Append Timestamps: Indicates, whether a timestamp shall be appended to the message

9.1.7.4 Serial FDM Telegrams

9.1.7.5 Standard FDM String

The STANDARD string is a sequence of 62 ASCII characters containing the frequency F, the frequency deviation FD, the REF time, the power line time PLT and the timedeviation TD, each item separated by a space character. The string is sent out at the beginning of every new REF time second and ends with the characters Carriage-Return (Hex code 0Dh) and Line-Feed (Hex code 0Ah). The letters displayed in italics are replaced by the calculated values whereas the other characters are part of the string:

\[ F:49.984\_FD:-00.016\_REF:15:03:30\_PLT:15:03:30.378\_TD:+00.378<CR><LF> \]

The meaning of the several values is described below:

**F:** 49.984  The measured power line frequency with a resolution of 1mHz

**FD:** -00.016  The frequency deviation between calculated and nominal frequency, with sign character (+/-), resolution: 1mHz, maximum: +99.999Hz

**REF:** 15:03:30  The reference time from the preconnected clock (hours:minutes:seconds)

**PLT:** 15:03:30.378  The power line time, based on the mains frequency, (hours:minutes:seconds.milliseconds) Time jumps, like changeover in daylight saving or leap seconds will not be executed by the PL time!

**TD:** +00.378  The time deviation between REF time and PL time, with sign character (+/-), resolution: 1ms, maximum: +99.999s

9.1.7.6 FDM Standard 2 Telegramm:

Like FDM standard, but it sends every 500ms instead of 1 per second.

9.1.7.7 Short FDM String

The SHORT string is a sequence of 23 ASCII characters containing simply information about frequency deviation FD and time deviation TD, separated by a space character. The string is sent out at the beginning of every new REF time second and ends with the characters Carriage-Return (Hex code 0Dh) and Line-Feed (Hex code 0Ah). The letters displayed in italics are replaced by the calculated values whereas the other characters are part of the string:

\[ FD:-00.016\_TD:+00.378<CR><LF> \]

The meaning of the several values is described below:

**FD:** -00.016  The frequency deviation between calculated and nominal frequency, with sign character (+/-), resolution: 1mHz

**TD:** +00.378  The time deviation between REF time and PL time, with sign character (+/-), resolution: 1ms
9.1.7.8 FDM Areva String

The Areva string is a sequence of 71 ASCII characters containing the frequency F, the frequency deviation FD, the time deviation TD, the power line time PLT and the reference time REF (preceded by the 3 digit day-of-the-year), each item separated by the characters Carriage-Return (Hex code 0Dh) and Line-Feed (Hex code 0Ah). Each of the five data items is preceded by a fixed 3 digit address (020 ... 024). The string starts with the STX character (start-of-text, Hex code 02h) and ends with a terminating ETX character (end-of-text, Hex code 03h) on time with the change of the REF time seconds. The letters displayed in italics are replaced by the calculated values whereas the other characters are part of the string:

<STX> 02049.984<CR><LF>
021-0.016<CR><LF>
022+00.378<CR><LF>
02315_03_30.378<CR><LF>
024068_15_03_30_<CR><LF>
<ETX>

The meaning of the several values is described below:

- **49.984**  
The measured power line frequency with a resolution of 1mHz

- **-0.016**  
The frequency deviation between calculated and nominal frequency, with sign character (+/-), resolution: 1mHz

- **+00.378**  
The time deviation between REF time and PL time, with sign character (+/-), resolution: 1ms

- **15_03_30.378**  
The power line time, based on the mains frequency, (hours_minutes_seconds.milliseconds)  
  Time jumps, like changeover in daylight saving or leap seconds, will not be executed by the PL time!

- **068_15_03_30**  
The reference time from the preconnected clock, (day-of-the-year_hours_minutes_seconds)
9.1.7.9 TPC FDM String

The TPC string is a sequence of 29 ASCII characters containing the REF time (with day-of-the-year), the time deviation TD and the frequency deviation FD. The string starts with the SOH character (start-of-header, ASCII code 01h) on time with the beginning of every new REF time second and ends with the characters Carriage-Return (ASCII code 0Dh) and Line-Feed (ASCII code 0Ah). The letters displayed in italics are replaced by the calculated values whereas the other characters are part of the string:

<SOH>288:10:11:29 -00.03F+50.01<CR><LF>

The meaning of the several values is described below:

- 288:10:11:29: the reference time from the upstream radio clock, (day of year:hours:minutes:seconds)
- ' ' oder '?' if reference time is synchron then ' ' otherwise '?'
- -00.03: the mains frequency deviation from the setpoint, resolution 1mHz
- F+50.01: The power line frequency, 10mHz resolution

9.1.7.10 Computime Extended FDM String

The extended Computime string is a sequence of 42 ASCII characters containing the REF time (with date and day-of-the-week), the time deviation TD and the frequency F. The string is send out at the beginning of every new REF time second and ends with the characters Carriage-Return (Hex code 0Dh) and Line-Feed (Hex code 0Ah). The letters displayed in italics are replaced by the calculated values whereas the other characters are part of the string:

T:10:03:09:02:15:03:30D:+000.378F:49.984<CR><LF>

The meaning of the several values is described below:

- T:10:03:09:02: The date of the reference time from the preconnected clock, (year:month:day:day-of-the-week / Monday = 01, Sunday = 07)
- 15:03:30: The reference time from the preconnected clock, (hours:minutes:seconds)
- D:+000.378: The time deviation between REF time and PL time, with sign character (+/-), resolution: 1ms, maximum: +-99.999s (the first digit is always 0!)
- F:49.984: The measured power line frequency with a resolution of 1mHz
9.1.7.11 FDM Fingrid String

Configure Fingrid string in serial parameters (for corresponding serial port) as output string type and use the mode ‘On request only (?)’. Send ‘T’ or ‘?’ to get the respond string exactly with the change of the next second, within 1000ms. To correct the Time Deviation via serial command please use the given format, if the Time Deviation has accepted, the FDM180 acknowledges the command and applies the value within the next 2 seconds.

Example of setting TD to 6.780:

to FDM180 ← \text{F27 PS B3} \ +6.780<CR><LF>
from FDM180 → \text{F27}<CR><LF>

Example of Fingrid:

Date: 20 March 2017
Time: 08:13:55 (UTC)
Time Deviation: +6.780s
Frequency Deviation: +0.012Hz

to FDM180 ← \text{T} \ (at 08:13:54.xxx)
from FDM180 → \text{079:08:13:55.000 T}+6.780F+0.012<CR><LF>

079:08:13:55.000 Reference time from the preconnected clock, (yeardays:hours:minutes:seconds:milliseconds)

T+6.780 The time deviation between REF time and PL time, with sign character (+/-), resolution: 1ms

F+0.012 The frequency deviation between calculated and nominal frequency, with sign character (+/-), resolution: 1mHz

9.1.7.12 FDM III String

Configure FDM III string in serial parameters (for corresponding serial port) as output string type.

Example of FDM III String:

Date: 09 March 2017
Time: 12:17:55 (UTC)
Time Deviation: -1.573s
Frequency Deviation: +0.095Hz

068:12:17:55?T-01.537F+0.123SF+60.095ST12:17:53.463<CR><LF>

068:12:17:55 Reference time from the preconnected clock, (yeardays:hours:minutes:seconds)

? Local FDM status ("" sync or "?" not sync)

T-01.537 The time deviation between REF time and PL time, with sign character (+/-), resolution: 1ms

F+0.123 The frequency deviation between calculated and nominal frequency, with sign character (+/-), resolution: 1mHz

SF+60.095 The measured power line frequency with a resolution of 1mHz

ST12:17:53.463 The power line time, based on the mains frequency, (hours:minutes:seconds:milliseconds)
9.1.7.13 Error-Bits

The FDM module registers errors and overflows and sets or deletes eight error bits then. In this way, the user can find out if an 'Overflow' occurs for example. These error bits document various error causes that occurred during operation.

The displayed value has the format: \textit{X8 X7 X6 X5 X4 X3 X2 X1}

\begin{itemize}
  \item \textbf{X8}: A2 Overflow, analog output 2 has reached its final value
  \item \textbf{X7}: A1 Overflow, analog output 1 has reached its final value
  \item \textbf{X6}: Time Deviation Overflow, the time difference is greater than +- 99.999s
  \item \textbf{X5}: Frequency Overflow, the frequency deviation is greater than the configured max./min values
  \item \textbf{X4}: REF Free, no sec-impulse from the reference
  \item \textbf{X3}: Power Line Time Free, no power line frequency (power line time remains at the last value)
  \item \textbf{X2}: No Time String, no serial time telegram received
  \item \textbf{X1}: No Power Line Time Init, the power line time has not (yet) been initialized
\end{itemize}

The error bits can be read out serially on request by an 'E' (ASCII code 45h) via the interfaces COM 0/1.

The format of the response string is:
\texttt{ERROR:X8X7X6X5X4X3X2X1<CR><LF>}

9.1.8 System

9.1.8.1 General Settings

Contact:
An input field for storing the contact information. The information is also displayed on the main page of the web interface and can be queried via SNMP.

Location:
An input field for storing the device location. The information is also displayed on the main page of the web interface and can be queried via SNMP.

Web Interface Language:
Language setting of the web interface.

Auto Expand Menus:
If this feature is enabled all sub-menus will be expanded in each configuration dialogue.

Automatically Activate Config Changes As Startup Config:
If this option is enabled, each configuration change is immediately added to the startup configuration of the LAN-TIME (the startup configuration is the configuration that is used when the LANTIME is booted). If the option is not activated, the following note is displayed in the header of the Web interface after each configuration change.

Each configuration change can then be saved as start configuration by confirming with “Save as startup configuration now” button.
9.1.8.2 Services and Functions

Reboot Device:
Initiates a restart of the LANTIME operating system. The built-in reference clock and output signals generated by the clock remain unaffected.

Download SNMP MIB:
Download the Meinberg SNMP MIB files. The archive file contains all Meinberg SNMP MIB files. To monitor a LANTIME time server with a V7 firmware via SNMP, only the MBG-SNMP-ROOT-MIB.mib and MBG-LANTIME-NG-MIB.mib files from the archive file are required.

Resend Current Error Conditions:
The button can be used to send the user the LANTIME error logs via e-mail or SNMP Trap. In order to use this function, the error events must be activated on the "Notification" page under "Notification Events" for the desired channel (e.g., e-mail or SNMP). An e-mail receiver or SNMP trap receiver must also be configured.

Reset Error Relay:
With this button the error relay can be set to an error-free position.

Activate Physical Identification:
This function can be used to find a LANTIME device. After the button is activated, the LANTIME starts to beep once per second and the alarm LED at the front panel flashes red. The function is terminated by pressing the "F2" button on the front panel.

Reset Factory Defaults:
Resets the LANTIME to factory defaults. (Attention: The network settings are retained during the reset via the web interface. If the network settings need to be reset as well, the reset must be initiated via the front panel.) During the reset, LANTIME restarts. After restarting the LANTIME can be reconfigured with the default user "root" and password "timeserver".

Send Test Notifications:
Sending a test notification to the configured e-mail recipients and/or SNMP trap receivers.

Save NTP Drift File:
The NTP service determines the offsets of the system clock at runtime and stores them in the so-called NTP drift file. This file is used by the NTP service to automatically adjust the system clock, even if no time source is currently available at short notice.

The "Save NTP Drift File" function saves the current NTP drift file /etc/ntp.drift on the internal Compact Flash card at /mnt/flash/data/ntp.drift. When the LANTIME is restarted, the value from the stored drift file can be read out by the NTP service, which accelerates the initial time adjusting process.

Manual Configuration:
The "Manual Configuration" button allows a direct access to the configuration files of the LANTIME. This feature should only be used by experienced administrators.
NIC Manager
The NIC Manager checks the system for physical network interfaces. This applies to the additional interfaces that can be added to the system via LNE modules. After the installation and initialization of an LNE card, the function must be executed so that the file "etc/mbg/net.cfg" is rewritten. The network port status can then be displayed on the start page of the web interface.

The NIC Manager function should also be executed after removing or replacing an LNE. The system uses the MAC addresses of the individual network ports to check whether they exist, whether their position (slot) in the system has changed or whether new interfaces exist.

Rescan Refclocks
This function must be executed if a second clock is subsequently installed in IMS systems in order to obtain a redundant receiver configuration. After start-up, the system remembers the serial connection of the reference clock used. If, for example, an M3000- or M1000 system with built-in RSC a second clock will be installed during operation (hot-plug), the "Rescan Refclocks" button must be pressed to register the new clock so that the serial connection of the second clock will be saved on the system.

9.1.8.3 Manual Configuration

With "Manual configuration" you are able to change the main configuration by editing the configuration file by hand. After editing, press the "Save file" button to preserve your changes, afterwards you are asked if your changes should be activated by reloading the configuration (this results in reloading several subsystems like NTPD, HTTPD etc.).
9.1.8.4 User Management

**LANTIME - System**

User Administration

- Change Current User Password
- Create User
- User List
- External Authentication Options
- Add External Authentication Server
- External Authentication Server List
- Password Options

![User Management Interface]

**Change Current User Password**

Here you can change the password of the currently authenticated user.

![Change Current User Password Form]

**Create User**

It is possible to create multiple user accounts on a LANTIME system, each account can be assigned one of three access levels: the Super-User level has full read-write access to the configuration of the LANTIME system, it can modify all parameters and has full shell access to the system when logging in via Telnet, SSH or serial console port. Administrator level accounts can only modify parameters via the WEB interface but does not have shell access. The access level "Info" can only review status and configuration options but is not allowed to modify any parameters or configuration files.
The table below illustrates the user-rights of each access level in detail.

<table>
<thead>
<tr>
<th></th>
<th>Super User</th>
<th>Admin User</th>
<th>Info User</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full access to the Command Line</td>
<td>✔</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Change device configuration through the WebUI</td>
<td>✔</td>
<td>✔</td>
<td></td>
</tr>
<tr>
<td>Editing of the additional configuration files, which are available through the WebUI*</td>
<td>✔</td>
<td>✔</td>
<td></td>
</tr>
<tr>
<td>Perform Firmware Update</td>
<td>✔</td>
<td>✔</td>
<td></td>
</tr>
<tr>
<td>Create a diagnostic file</td>
<td>✔</td>
<td>✔</td>

</tr>
<tr>
<td>Create a new super user account</td>
<td>✔</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Review all webinterface configuration values</td>
<td>✔</td>
<td>✔</td>
<td>✔</td>
</tr>
</tbody>
</table>

*Additional Network Configuration, Additional NTP Configuration, User defined notifications

User List
This submenu gives you an overview of all configured LANTIME users. By clicking "Delete User" a single user can be deleted.
9.1.8.5 External Authentication Options

The LANTIME supports Radius and TACACS as external authentication methods.

Enable External Authentication:
Through this checkbox you can either enable or disable the external authentication feature of the LANTIME.

Timeout (ms):
Period of time how long to wait for an "access accept" packet from an authentication server.

You can choose between several Authentication Methods:

RADIUS:
Radius stands for Remote Authentication Dial In User Service and provides centralized authentication for LANTIME devices. RADIUS is a client/server protocol that runs in the application layer, using UDP as transport protocol.

The LANTIME RADIUS authentication requires that each account that should be able to login to the LANTIME has a Vendor Specific Attribute (VSA) called MBG-Management-Privilege-Level configured. This VSA has to be added to the RADIUS configuration of an external authentication server. Here some additional Information on the attribute:

Name = MBG-Management-Privilege-Level  
Datatype = Integer  
Vendor-Code = 5597  
Vendor assigned attribute number = 1  
Value range = 100, 200, 300

In addition you need to assign a value of 100 (Super User), 200 (Admin User) or 300 (Info User) for this attribute for each RADIUS user, which should be able to login to the LANTIME.
TACACS:
Terminal Access Controller Acc-Control System is a remote authentication protocol that gives the LANTIME the possibility to communicate with a TACACS authentication server.

The LANTIME TACACS authentication requires that each account that should be able to login to the LANTIME has configured an attribute called 'priv-lvl'. This attribute needs to be configured on the TACACS Server.

For a Super-User account the attribute has to be "100", for an Admin account "200" and for an Info User account "300". In the following an example of a tac_plus server configuration file:

```plaintext
# This is the shared secret that clients have to use to access Tacacs+
key = meinberg

# User Groups

group = lantime_super_user {
    service = lantime_mgmt {
        priv-lvl = 100
    }
}

group = lantime_admin_user {
    service = lantime_mgmt {
        priv-lvl = 200
    }
}

group = lantime_info_user {
    service = lantime_mgmt {
        priv-lvl = 300
    }
}

# User

# LANTIME Super User
user = tacacs_su {
    member = lantime_super_user
    pap = cleartext "tacacs_su" # User Password
}

# LANTIME Admin User
user = tacacs_au {
    member = lantime_admin_user
    pap = cleartext "tacacs_au" # User Password
}

# LANTIME Info User
user = tacacs_iu {
    member = lantime_info_user
    pap = cleartext "tacacs_iu" # User Password
}
```
Add External Authentication Server

Through this form you can add an external authentication server to the LANTIME configuration. The external authentication has to be enabled first in the “External Authentication Options” menu.

**Authentication Method:**
Configuration of the authentication method to use, either Radius or TACACS+. More detailed information on both methods can be found in the upper part of this chapter.

**Authentication Server:**
The IP or Host of the selected Authentication Server (IPv4 and IPv6 are supported).

**Shared Secret:**
A shared secret is used for a basic authentication between a LANTIME and the authentication server. The shared secret of the external authentication server has to be entered in this field. A list of allowed signs which can be used for the shared secret you can find in the chapter “Before you Start → Text and Syntax Conventions”.

**Port:**
Depending on the authentication method, the default port is already configured here. If needed, the port can be changed.

**External Authentication Server List**

This table gives you a quick overview of the configured authentication servers. Each server can be removed by either a Super– or Admin–User by clicking the “Delete Server” button.
9.1.8.6 Password Options

This sub menu provides some general password settings.

**Minimum Password Length:**
This parameter sets the minimum number of characters of a password before it is accepted by the system as a valid password. This value is used when creating a new user as well as when you change a current user password. Former created passwords are not affected. The maximum length of a password is 64 characters.

**Allow secure passwords only:**
If this option is activated, only secure passwords will be allowed. A secure password needs at least:

- one lower character [a-z]
- one upper character [A-Z]
- one digit [0-9]
- one special character

A list of allowed signs which can be used as special characters you can find in the chapter "Before you Start → Text and Syntax Conventions")

**Users must change password periodically:**
Users will be forced to change passwords at regular intervals. If a password is expired the user can not log in to the unit before changing his current password. Possible intervals:

- Monthly
- Quarterly
- Half-Yearly
- Yearly

**Disable password autocompletion in browser:**
After this feature is enabled, your browser will not autocomplete the credentials of a LANTIME.
9.1.8.7 System Information

The "System Information" menu offers the possibility to view important log files and setups of the LANTIME.

- **Show System Messages**: Displaying the LANTIME SYSLOG file stored in /var/log/messages
- **Show Device Version**: Displaying the additional device information (model, firmware, serial number, built-in hardware components, etc.)
- **Show Receiver Information**: Displaying the additional status information on the built-in reference clock.
- **Show Process List**: Displaying all currently running processes.
- **Show Reboot Log**: Displaying the reboot logs stored in /mnt/flash/data/reboot.log. The log file contains information about past system reboots.
- **Show Time Related Messages**: Displaying the file /var/log/lantime_messages.
- **Show Device Options**: Displaying additional system parameters.
- **Show Routing Tables**: Displaying the network routing table.
- **Show Ifconfig Output**: Displaying information for all network interfaces (output of the command "ifconfig -a")
9.1.8.8 Firmware/Software Update

If you need to update the software of your LANTIME, you need a specific update file. You can download the latest LANTIME firmware version from our website: https://www.meinbergglobal.com/english/sw/firmware.htm

The update file can be uploaded to the LANTIME by first choosing the file on your local computer with the "Browse" button and then press "Start Update". Afterwards you are prompted to confirm the start of the update process.

Errors may be detected during installation, such as an unusable update package or a missing signature of the update file. For security reasons, some information is displayed during installation. The following is an excerpt of possible warning or info messages:

Running Preflight Checks
Checking digital signature of file ...
WARNING: This file does not seem to have been digitally signed, please double check that it is a valid update file and has not been corrupted/modified.
OK: Installation file is readable.
INFO: This is a release file, image version is 6.24.21
OK: Update file is suitable for this system [x86].
ERROR: This update does not provide the following required features: cq7atom_support

This example shows the attempt to install an update package that does not support the CPU’s Q7 processor.
9.1.8.9 Download Diagnostic File

A diagnostic file which includes all status data of a LANTIME system logged since the last reboot can be downloaded from all LANTIME servers. The file format of the diagnostic file is a tgz-archive. The archive contains all the important configuration and logfiles. In most support cases it is the first action to ask the user to download the diagnostic file, because it is very helpful to identify the current state of the LANTIME and to find possible errors.
9.1.8.10 Configuration and Firmware Management

With this menu you can save different configuration files for backup on the flash memory of the LANTIME. By using the "Activate" button a stored configuration can be loaded, the "Delete" button can be used to delete a configuration file and the "Download" button in order to download a file.

Additionally more than one Firmware version can be archived on the LANTIME. If an updated version is not corresponding correctly in the environment, then it is possible to reactivate one of the established versions again on the LANTIME.

Remove unneeded Versions

With this button all unused firmware versions can be deleted. Only the active firmware and the OSV (Original Shipped Version) remain on the system.
9.1.8.11 Display

**Front Panel Light Enabled:**
Through this checkbox the front panel display light can be switched on permanently.

**Time Zone:**
Time Zone setting for the front panel display of the LANTIME and the time which is shown in the "Date/Time" section of the Main page in the web interface. Note: This setting does not affect the time which is provided by the LANTIME through NTP, PTP, serial time strings or IRIG.

**Exception:**
In the case NTP is configured to provide local time instead of UTC you need to configure the exact local time zone here in the display time zone setting. This setting is then used for NTP as well.

**Edit Time Zone Table:**
The button "Edit Time Zone Table" can be used to add new timezone definitions.
Example:

(UTC+1) - CET/CEST, 0, 25.03.****, +, 02:00, 02:00:00, CET, 0, 25.10.****, +, 01:00, 03:00:00

The string above is the time zone definition for middle Europe. If you require a new time zone setting, this needs to be configured in the same format. The string contains different information, each information is separated by a comma. A detailed description of different string parts shown by an example of the time zone setting for middle Europe is as follows:

1. Field: Display name of the time zone. This name is shown in the list of available time zones → (UTC+1) - CET/CEST
2. Field: Abbreviation of time zone with daylight saving (max 4 letter) → CET
3. Field: Day of week of changeover to daylight saving time → 0 (Sunday)
4. Field: Date of changeover to daylight saving time (dd.mm.****) → 25.03.**** (Changeover will take place at the first Sunday starting from 25.03.)
5. Field: Sign (+ or -) Add or subtract offset from UTC → +
6. Field: UTC Offset daylight saving (hh:mm) → 02:00
7. Field: Time of changeover → 02:00
8. Field: Abbreviation of standard time zone → CEST
9. Field: Day of week of changeover to standard time → 0 (Sunday)
10. Field: Date of changeover to standard time (dd.mm.****) → 25.10.**** (Changeover to standard time will take place at the first Sunday starting from 25.10.)
11. Field: Sign (+ or -) Add or subtract offset from UTC → +
12. Field: UTC offset (hh:mm) → 01:00
13. Field: Time of changeover → 03:00
9.1.8.12 Fan Control

These parameters are only available on LANTIME IMS devices with a built-in fan module.

### Fan Control

<table>
<thead>
<tr>
<th>Control Mode</th>
<th>Setting of the operating mode. The following options are available:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatically</td>
<td>With this mode, the fans switch on automatically as soon as the current system temperature exceeds the configured temperature threshold.</td>
</tr>
<tr>
<td></td>
<td>On: In this mode the fans run permanently.</td>
</tr>
<tr>
<td></td>
<td>Off: In this mode the fans are permanently turned off.</td>
</tr>
<tr>
<td>Temperature Threshold (°C)</td>
<td>Specification of the system temperature threshold in degrees Celsius. The configured temperature value is taken into account for control of fans when the fan mode “Automatically” is selected.</td>
</tr>
<tr>
<td>Status Fan 1</td>
<td>Status display of the 1st fan.</td>
</tr>
<tr>
<td>Status Fan 2</td>
<td>Status display of the 2nd fan.</td>
</tr>
<tr>
<td>Current Temperature (°C/°F)</td>
<td>Displaying the current temperature in degrees Celsius and Fahrenheit.</td>
</tr>
</tbody>
</table>
9.1.8.13 Redundant Power Supply

If your LANTIME is an IMS system, all available power supplies and power consumer are displayed and evaluated in this submenu.

![Redundant Power Supply Table]

**Power Consumption Info**

The available power depends on the number of used power supply units. In the example we have three power supply units, each with 50W of power – this results in a total of 150W when all power supply units are in active state.

As long as, as in this example, a value below 50W is displayed in the field "Current Power", only one power supply is sufficient to supply this system. If the value is greater than or equal to 50W, two power supply units are required for supply or three active power supply units are required to ensure redundancy.

The "Redundancy" field is set to "Available" if the "Available Power" minus the "Current Power" is greater than or equal to 50W. The "Overload" field always displays "No" as long as the "Current Power" is less than or equal to "Available Power".

**Consumer Load**

This table lists all consumers of the system. The backplane, the CPU, the power supplies, the receivers and all other modules used. The sum of all consumers gives the value that is displayed as Current Power.
9.1.9 Statistics

9.1.9.1 NTP Performance Graph

In the submenu NTP performance graph, the NTP statistics (loopstats) are displayed in the form of a graph.

The red lines and the primary Y-axis represent the offset between the system time and the NTP reference time source (in ms). The blue line and the secondary Y-axis, on the other hand, illustrate the frequency adjustment of the oscillator which is built on the CPU by the ntpd (in PPM), to adjust the system time to the reference time source.

The minimum and maximum measured value of the frequency deviation and offsets can be read in the upper right corner.

Available Log Files:
You can select the available log data via the dropdown menu. The ntpd creates a new loopstats file for each day.
Merge Statistic Files:
After activating the checkbox and clicking on "Generate Graph", all available log files are merged and displayed as one graph.

9.1.9.2 PTP V2 Statistics

This graphic is only available if the LANTIME is equipped with a PTP module, which is configured as PTP SLAVE.

The red line shows the time offset between the time of the built-in reference clock and the incoming PTP signal (in micro s). The blue line shows the path delay determined by the PTP module.
9.1.9.3 NTP Status

This menu displays the output of the NTP command "ntpq -p". The command lists all reference time sources (peers) that are available to the NTP service. The following example shows the "ntpq -p" output from a LAN-TIME with a built-in GPS reference clock and 2 configured external NTP time servers:

![NTP Status Table]

Remote IP:
IP address of the NTP peer or 127.127.x.x if it is a hardware time reference, e.g. a radio clock or a GPS receiver.

A legend of codes standing next to each IP address of NTP peers is the following:

- "*: This server is selected for synchronization.
- "o": The system synchronization is derived from a pulse-per-second (PPS) signal, either indirectly via the PPS reference clock driver or directly via a kernel interface.
- "+": The peer is a candidate for synchronization.
- "-": The server is not suitable for synchronization.
- "x": The server is detected as a falseticker and not suitable for synchronization.
- "#": The server is a survivor, but not among the first six servers.
- ": The peer is discarded as unreachable or synchronized to this server (sync loop).

Remote Host:
Resolved DNS name

RefID:
The time reference of the NTP peer.

Stratum:
Stratum value of the NTP peer.

Type:
Type of the NTP Peer:

- l: local reference clock
- b: broadcast or multicast
- u: unicast
- s: symmetric peer
- a: manycast

When:
Value in seconds. Indicates when the NTP peer was last queried.

Poll:
Period in seconds. Specifies the interval at which the NTP peer is queried.
Reach:
Octal value. Indicates the status of the last 8 queries. The value "377" means that the last 8 queries were successful.

Delay:
Value in ms. Displays the runtime of the NTP packet.

Offset:
The NTP software compares its own system time at regular intervals with its reference time sources. This process is called 'polling'. After each polling operation, the packet trip time is determined, calculated, and the current time difference ('offset') is calculated and displayed in milliseconds.

Jitter:
The packet trip time changes more or less depending on the characteristics of the network during the "polling" of external NTP sources at each time comparison, and the calculated time offset also varies. For this reason, the results of successive time comparisons are filtered by calculating weighted mean values for packet run time and time offset. The deviations of the individual values from these mean values are referred to as 'jitter', and the higher the jitter value, the less accurate is the calculated time offset. On the other hand, a steadily increasing mean time offset indicates that the system time drifts away from the reference time. The value is displayed in milliseconds.
9.1.9.4 NTP Monlist

The submenu "NTP Monlist" lists all NTP clients which have queried the LANTIME time via NTP. The list is created and displayed using the NTP Query Tool. The following ntpq command is issued: ntpq -c mrulist

More information about the NTP Query Tool can be found in the NTP documentation at http://doc.ntp.org/current-stable/ntpq.html

<table>
<thead>

**Last:**
Time in seconds. Specifies when the client requested the time from the LANTIME.

**Avg Interval:**
Average time in seconds between two NTP requests.

**Rstr:**
Shows if there are active Restrict Flags for this remote IP.

**R:**
Indicates whether the "Rate Control" is active or not.

**M:**
NTP package identification
0 → reserved
1 → symmetric active
2 → symmetric passive
3 → client
4 → server
5 → broadcast
6 → NTP control message
7 → reserved

**V:**
NTP Version

**Count:**
Number of packets received from the remote address

**Rport:**
"Source Port" of the last received packet

**Remote Address:**
IP Address of the requesting device
9.1.9.5 NTP Debug

The NTP Debug submenu displays NTP debug information queried by the LANTIME using the NTP Query Tool (ntpq). The "ntpq" is executed with the following parameters:

- "clockvar"
- "associations"
- "readvar"

More information about the query tool can be found in the NTP documentation at http://doc.ntp.org/current-stable/ntpq.html
9.1.9.6 NTP Client List

In addition to the native NTP logging functions, the LANTIME offers the possibility to maintain a list of all NTP clients. The function is switched off by default, and can be activated if desired.

### Activate Logging:
Activates the feature on the LANTIME.

### Duration of Recording:
The duration for which the LANTIME maintains the client list. When configuring continuous recording, old daily statistics are automatically cleared after a few days in order to save space.

### Log Level:
Determines which version of the IP protocol is taken into account. Available are IPv4, IPv6 or both versions in combination.

### Available Log Files:
If the client logging is activated, log files for display are provided at this point. Select the desired daily statistics from the selection box and use the 'Show' button to display the statistics. You will then receive a list of clients as well as other statistics.

### NTP Client List Table

<table>

A click on Details will now also show you detailed information about the received NTP packets of a particular client.

- Columns 0–23 indicate the hour of the day.
- The 3 additional lines provide information on whether the received NTP packet had mode 3, 4, or another. Modus 3, 4 oder einen anderen hatte.
- Modus 3 → Client
- Modus 4 → Server
9.1.10 Clock

On this page of the web interface, configurations can be made on the respective installed reference clocks or the changeover card.

Depending on the design of the system, which means whether it is a single reference clock or a system with two installed remote clocks and a changeover card, the web interface builds up accordingly. This also applies to the type of reference clock and its options. In case of a redundant receiver configuration the common settings for "IRIG In/Out", "Serial Ports", "Time Zone", "Enable Outputs", "Programmable Pulses" and "Synthesizers" appears into the "Switch Card" menu.

Figure: Menu "Clock" in case of a single receiver
9.1.10.1 MRS Status
Here the states of the reference inputs are shown:

**Priority:** Arrangement of the time source according to your prioritization.

**Source:** Type of reference source.

**Status:**
- **No Connection,** → the reference source is not available.
- **No signal,** → the reference source is available.
- **Signal available,** → the reference source is used to synchronize the system.
- **Is master,** → the system synchronizes itself to the reference source.
- **Is locked,** → Basic accuracy of synchronization reached.

**Offset:** Time difference of the reference clock to the specified time source.

**Statistics:**
- **Span** → If the difference between the min / max value of the time source is over a defined statistical interval.
- **Step-Compensation** → Displays a hard time jump of the reference source (currently only available for PTP).
- **Auto-Bias** → Time offset determined for the source versus an offset-free time source.

*Figure: An example of available reference signals in the priority order.*
9.1.10.2 MRS Settings

The MRS stands for a Multi Reference Source clock. This is a special functionality of a receiver that can in addition to GNSS use also other input signals as a reference for synchronization.

9.1.10.3 MRS Source Priority

In the MRS Settings you can configure a priority list of input signals how the switching will follow in case that a master reference becomes unavailable. The selection of signals in the list is automatically generated by the LANTIME according to the hardware configuration. The priority list of input signals should be configured in a descending order referring to the accuracy of signals.

Here is an example how to configure a priority list in a descending order:

1. Source: GNSS / GPS
2. PPS + String
3. PTP – IEEE1588
4. external NTP Server

![Status & Configuration](image)

*Figure: Configuration example of reference signals in a descending order.*
9.1.10.4 IRSA - Intelligent Reference Selection Algorithm

IRSA stands for an Intelligent Reference Selection Algorithm. In case that a master signal fails the IRSA takes care that the switching to the next reference signal in the priority list runs automatically and smoothly. The IRSA also takes into account the highly stable holdover performance of the local oscillator. It ensures that switching from the superior reference signal to the less accurate one is delayed as long as the highly stable oscillator can provide better accuracy in holdover than the next available reference signal in the priority list.

![IRSA - Intelligent Reference Selection Algorithm](image)

Figure: Activated IRSA mode with estimated precision values for available references.

To ensure that IRSA is working properly, follow these steps:

1. Configure a priority list of available reference signals in descending order from the superior to inferior one in the MRS Settings menu (see chapter MRS Source Priority).
2. Activate IRSA in the IRSA menu. As per default the IRSA is deactivated.
3. Fill in the estimated precision values for the input reference signals in for this provided "Precision" column. According to the estimated precision values the holdover time between current source and the next source from the priority list will be calculated.

Here are some estimated precision values which you can load as defaults:
- GPS / GNSS as the first priority has the highest estimated precision :100 ns
- ext. Osc. (e.g. Rubidium): 120 ns
- PTP IEEE 1588: 100 ns
- PPS plus string: 100 ns
- NTP: 100 us
9.1.10.5 MRS Features

Advanced Source Selection

A firmware V6.24 and the following versions support a mixed combination of reference signals for synchronization. In the mixed mode you can select one source only for the ToD (Time of Day) synchronization and another source for phase and frequency. The phase and frequency can be provided by a highly stable and accurate source, for example an atomic clock, like Rubidium or Cesium.

The Time of Day (ToD) information represents a “wall clock time” – a specific time with hours, minutes, seconds and the corresponding date. The ToD information cannot be delivered by an atomic clock alone. Therefore, if you need the ToD in your system, you need to select one of the reference signal which includes the ToD information, for example GPS, NTP, PTP, PPS plus string.

If you use the mixed mode the reference clock will be steered first by a reference signal which includes the ToD. The oscillator will be roughly adjusted until it reaches the highest level of accuracy that can be achieved by this reference. After that the reference clock switches automatically to a more accurate source, for example a 1PPS coming from an external atomic clock that provides highly stable phase or a 10MHz signal to provide a stable frequency.

As per default both ToD and Phase are enabled for each available reference source. If you want to use the mixed mode, then select the ToD for one reference signal and phase for another. The reference sources you wish to use should be configured first in the Source Priority list. See MRS Settings → MRS Source Priority.

Here is one configuration example for Advanced Source Selection:

![Image: MRS Source Priority settings](https://example.com/image.png)

*Figure: An example for a mixed combination of ToD and Phase source for given reference signals.*

PTP Min. Clock Class

The MRS system should only use a PTP master to synchronize the clock if the desired clock class is given. It should be prevented that the slave remains synchronized to a bad master, although another source is available.
9.1.10.6 Extended Options

The Trusted Source (TRS) feature is a powerful tool to protect the GNSS receiver from spoofing attacks. For the moment, the Trusted Source feature is supported only in combination with a Meinberg GPS or GNSS receiver and a Meinberg XHE external Rubidium holdover unit.

To activate this feature, select "Use Trusted Source" check box for the GPS reference signal. It means that GPS reference will be checked for consistency by another reference source which is acknowledged as a Trusted Source. In our case the trusted source is a Rubidium atomic clock. It is denoted as extOsc. (external oscillator) in the table of Extended Options. Therefore select this check box "Is Trusted Source".

The Trusted Source (TRS) feature is supported only in combination with GPS180 and GNS181 receivers.

</tr>
</tbody>
</table>

Figure: An example of a Trusted Source mode of operation with an external rubidium.

The precision for GPS or GNSS is at same time also the TRS limit, that the reference should comply with. If the TRS limit is violated the reference selection algorithm discards the current master and switches automatically to the Trusted Source - XHE Rubidium. For the GPS or GNSS precision value we take 250ns which is maximum time deviation allowed for the receiver.

Finally, the GPS or GNSS source should have enabled "Time of Day Source" and "Phase Source", which means that the receiver is a source for both Time of Day and Phase. At the XHE Rubidium only the Phase Source should be enabled, since the atomic clock alone does not deliver the ToD information.

Auto Bias Master / Auto Bias Slave

"Auto Bias" provides a technology for a situation where a constant offset which is present with a given input signal can be measured and compensated against a trusted reference automatically. The reasons for this constant offset could be a cable delay which introduces a fix offset (5ns per each m of coax cable and 3ns for fiber), a delay caused by an IRIG generator if IRIG is used as an input, or a constant offset via PTP due to a network or traffic asymmetry.

So, if you choose for example GPS as a reference signal at priority 1 while having "Auto Bias Master" ac-
tivated for GPS, then GPS will be used as a measurement reference for all other sources as long as GPS is available.

If PTP is configured as a secondary priority with "Auto Bias Slave" activated, the constant offset of the PTP input signal is measured against the current "Auto Bias Master" reference (e.g. GPS) and will be compensated automatically.

Furthermore, even if PTP becomes a reference signal in case that a Master is not available, the PTP offsets will include a compensation for the initial offset measured against the previous Master automatically. In this operating mode a smooth transition from GPS to PTP will be possible without a time step in case GPS becomes unavailable.

If PTP is then a primary sync source and an asymmetry step suddenly occurs in the network (due to path rearrangements e.g.), the occurring asymmetry step will therefore be automatically compensated as well in case "Asymmetry Step Detection" is activated.

**Asymmetry Step Detection**

When Asymmetry Step Detection is activated, the PTP slave does not follow hard time jumps. The soft synchronization is retained and the time jump is displayed as an offset in the MRS statistics.
9.1.10.7 Fixed Offset and Limit

The "Fixed Offsets" and "Limits" can be entered by using the corresponding fields. The "Fixed Offset" specifies a fixed offset for each reference clock to the reference time. With this value, known and constant deviations of a reference time source can be compensated. No constant offset can be set for GNSS references - this can only be done indirectly with the antenna cable compensation time.

Limit:
Here you can configure a limit value. If the reference source exceeds this limit, a notification is triggered. A configuration in the Web Interface is required on the Notification page "Notification → Notification Event → XMR Limit Exceed".

Figure: Configuration dialog for known offsets and limits.
9.1.10.8 IRIG Settings

Depending on the system configuration, the configuration of the incoming and / or outgoing time codes can be configured in this menu. There are three common time codes:

**IRIG**
- B002+B122 – IRIG-B 100pps:
  - DC Level Shift (DCLS), No carrier (DCLS),
  - Time coding (HH,MM,SS,DDD)
  - Modulated, 1 kHz / 1 millisecond resolution,
  - Time coding (HH,MM,SS,DDD), Control Functions
- B003+B123 as well as B002+B122, with second of day (0...86400)

**AFNOR NF S87-500**
- AFNOR NFS 87-500 is a standardized French timecode similar to the IRIG code, but with additional information such as day, day of month and year.

**IEEE1344**
- In addition to a two-digit year, the offset to the UTC time, the current daylight saving time status and announcements from the start and the end of the summer time, as well as information about an upcoming leap second are transmitted.

**Input Code:**
Configuration of the incoming IRIG / AFNOR / IEEE 1344 time code (MRS systems only).

**UTC Offset:**
If the applied timecode is impinged with a constant time offset to UTC, this time offset must be configured here, so that the clock can convert the received time to UTC.

**Output code:**
If the system has direct TC output options, you can set the parameters in this menu section.

**Time Scale:**
The output of the selected time code can be done with UTC or the local time. When ”LOCAL TIME” is used, it refers to the configuration of the menu point ”Time zone”.
9.1.10.9 Serial Interfaces

Depending on the number and version of the system, the parameters for the serial interfaces can be configured in this menu.

**Baudrate:** The speed with which the serial telegram is to be transmitted:
- 300, 600, 1200, 2400, 4800, 9600, 19200

**Framing:** Structure of the telegram:
- 7E1, 7E2, 7N2, 7O1, 7O2, 8E1, 8E2, 8N1, 8N2, 8O1

**String Type:** Configuration of the time telegram to be sent.

**Mode:** You can configure an interval (per second, per minute, on request “?” Only) for the outgoing time string. If the operating mode is set on “Request”, a connected client must send a “?” to receive the time telegram in response.

**Features:**

**MRS PPS Plus String**
If the system has the MRS "PPS plus string" option, the baudrate and framing for the incoming time string must be configured via this submenu.

**Meinberg Capture *only for specific units*”**
This option is for systems that have a cap input. The event is triggered by a negative edge.

Two operating modes are available for the output of the capture time stamps, “on request ? Only” and “automatically”.

- **on request "?" only**
  The triggered events are stored in a buffer of the reference clock. As soon as a “?” is sent to the reference clock via a serial connection, the stored events are transferred from the buffer.

- **automatically**
  In this mode, the capture events are output directly on the serial interface.
9.1.10.10 Time Zone

In this menu, you can configure the time zones (offsets) for the output signals (IRIG, serial interface, programmable pulses) of the reference clock.

The data of the time zone are used from the time zone table (see chapter 9.1.8.11 System → Display).

9.1.10.11 Enabling the Outputs

Optionally, the outputs of the reference clock can be set to always supply a signal when the device is switched on, or only when the internal clock is running synchronously.
9.1.10.12 Programmable Pulses

If the system has programmable switching outputs, you can configure the parameters in this menu.

**Mode:** Output signal configuration.

**Pulse length (ms):** Pulse length configuration.

**Cycle:** For “Cycle Pulse” mode, an interval can be configured in hh: mm: ss.

**Time:** In the configured mode “Single Shot”, the time for the pulse can be parameterized in hh:mm:ss.

**DCF Suspend After (min):** In the “DCF77 Marks” mode, you can configure a shutdown time for the output port, so that in the case of an asynchrony of the reference clock, no DCF mark is available at the output.

**On / Off Time:** For the “Timer” mode, it is possible to configure start and stop times in hh:mm:ss.

**Signal:** Configuration of the output signal active in high or low.

**Disable output in Holdover mode:** If the reference clock is asynchronous, the output signal is immediately deactivated when the checkbox is activated.

**Note:** In the clock-submenu “Enabling the Outputs” the Pulses option “if sync” must be select so that the outputs can be switched off in holdover mode.
9.1.10.13 Synthesizer

The output frequency and phase of the integrated synthesizer can be set here.

**Frequency:** Frequencies from 1/3 Hz up to 10 MHz can be set by entering four digits and a frequency range. By entering the frequency 0 Hz, the synthesizer can be switched off.

**Phase:** With phase you can enter the phase position of the set frequency in the range $-180^\circ$ to $+180^\circ$ with a resolution of 0.1. When the phase angle is increased, the delay of the output signal gets bigger. If a frequency higher than 10 kHz has been set, the phase cannot be changed.
9.1.10.14 Miscellaneous

This menu item displays specific options of the reference clock.

**Antenna Cable Length (m):**

The signal propagation time of the antenna cable can be compensated by this value. The received time grid is delayed by approx. 5ns / m antenna cable. This time error is automatically compensated by entering the cable length. The default value is 20m. The maximum input value should not exceed 500m.
GPS Simulation Mode:
This menu allows the user to operate the time server without an antenna. Normally, the NTPD loses synchronization when the antenna or the external reference source is disconnected (red FAIL LED is turned on). By activating the simulation mode, the corresponding status information for the NTPD is permanently set to SYNC. This also makes it possible to transmit other times, which have been entered via the menu item "Initialize the receiver", to the NTPD. In normal cases, the checkbox should remain empty. If this box is activated, the status "Simulation mode" is displayed under "Info of the receiver" in the main menu.

GPS Time Scale:
UTC  Coordinated Universal Time (including leap seconds which are continuously updated)

If you change the timescale in the drop-down menu a warning message will appear in the browser window.

Please Note:
If the GPS receiver is configured to output GPS or TAI timescale instead of UTC, the distributed time via NTP isn’t based on UTC then. This is a protocol violation and this time server can’t be used to synchronize standard NTP clients which expect UTC time.

Log Satellite Visibility (GPS Receiver):
If this item is activated, a graphic is generated on which the constellation of the visible satellites are displayed.

SSM Quality Level in GPS Lock Mode:
If the system has E1 / T1 outputs, the quality level of the SSM can be configured here.

SNS Mode - Satellite Navigation System Mode (GNS Receiver):
If you are using a GNS receiver (GNS or GNS-UC with Up Converter), this drop-down menu allows you to select one or more satellite systems to be used simultaneously. The following combinations are available:

<table>
<thead>
<tr>
<th>GNS Receiver</th>
<th>GNS-UC Receiver</th>
<th>GNM-Receiver</th>
</tr>
</thead>

<tr>
<td>GPS/Galileo/BeiDou</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Distance to the Transmitter (km) - PZF / AM Receivers only:
In the menu item "Distance to the Transmitter" you can enter the transmitter distance in km, which is used for the delay compensation of the incoming PZF-signal. The adjustment of the distance should be made as precisely as possible, because it has a direct influence on the absolute accuracy of the time raster.

PZF Simulation Mode:
This menu allows the user to operate the time server without an antenna. Normally, the NTPD loses synchronization when the antenna or the external reference source is disconnected (red FAIL LED is turned on). By activating the simulation mode, the corresponding status information for the NTPD is permanently set to SYNC. This also makes it possible to transmit other times, which have been entered via the menu item "Initialize the receiver", to the NTPD. In normal cases, the checkbox should remain empty. If this box is activated, the status "Simulation mode" is displayed under "Info of the receiver" in the main menu.

9.1.10.15 Initialize Receiver

Warm Boot Mode only for GNSS receiver:
This menu allows the user to switch the receiver to WARMBOOT MODE. This may be necessary if the satellite data in the battery-buffered memory is too old, or if the device is operated at a location that is several hundred kilometers away from the last operating location, since the calculation of the visibility of the satellites yields incorrect results.

Cold Boot Modus only for GNSS receiver:
This menu allows the user to reinitialize all GPS system values, this means that all stored satellite data will be deleted. Please note that the receiver takes about 15 minutes to read-in the information of the satellites again, to complete the cold boot!

Coordinates (latitude, longitude, and altitude) "only GNSS receiver:
The absolute position of the GPS antenna can be entered here and can be sent to the GPS reference clock with 'initialize Position'. This option is useful when the system is operated at a different location and if started with the previously battery-buffered satellite data.

Time/Date:
With this function, the reference clock can manually be set to a specific date and time.
9.1.10.16 Receiver Information

This menu item lists all the important information and options of the reference clock.

**Explanation of GPS Satellite Status "Satellites in View" and "Number of Good Satellites"**

Satellites of the GPS and other GNSS systems are usually not stationary, but circle around the globe on well-known tracks, so each individual satellite may be above or below the horizon at a given location and time. Satellites that are below the horizon can't be tracked anyway, so the receiver uses its last known position and almanac data from the satellites to determine which satellites are currently expected to be above the horizon at its geographic position, and can potentially be tracked. All these satellites are called to be in *view*.

However, even some the satellites that are in view may be shielded by buildings, mountains, etc., so the receiver may be unable to track these satellites. Also, individual satellites may be temporarily in maintenance mode, so they must not be used even if they can be tracked. Only satellites that can be tracked and are not in maintenance mode are considered *good* and used to determine the current position and time.

So the number of *good* satellites can never exceed the number of satellites in view, but it can be significantly less if the antenna has been installed in a location with limited view to the sky. In worst case this can lead to limited accuracy, or only temporary synchronization.
9.1.10.17 Switch Card

The RSC (SCU) switch card is an automatic multiplexer for redundant systems with two Meinberg radio clocks. The card is used for the automatic switching of the pulse and frequency outputs as well as the serial interfaces of the connected clocks. The selection of the respectively active system is made, based on the state of the clock’s generated TIME_SYNC signals, which show the synchronous state of the clocks.

In order to avoid unnecessary switching operations, for example during periodic free running of a system, the order of the active and the reserve system is exchanged at every change-over. For example, if the active system switches to the free running mode while the reserve system is operating synchronously, it is switched over to the synchronous reserve system. A reset to the old state occurs only if the now active system (formerly the reserve system) loses synchronization, while the reserve system (previously active system) operates synchronously. If both systems operate in the free-running mode, no changeover is made and the current state is retained.

9.1.10.18 Receiver Information Switch Card

This menu item lists all the important information and options of the switch card.
9.1.11 I/O Configuration

This menu is available on IMS systems. Input and output modules can be configured here.

### 9.1.11.1 Input Configuration

#### 9.1.11.2 IMS-MRI (Multiple Reference Input)

If an application requires to use external synchronization sources instead of radio/GNSS signals, a MRI card enables the installed clock module to synchronize to 1PPS, 10MHz, DCLS and AM time codes.

Each MRI card is dedicated to one clock module. If a redundant solution requires external synchronization inputs for both clock modules, two MRI cards have to be installed. The MRI card is available with 4x BNC or 4x FO connectors.

**Basic reference input signals**
- 1PPS
- 10 MHz
- IRIG-AM (B, AFNOR, IEEE1344 / C37.118)
- IRIG-DCLS (B, AFNOR, IEEE1344 / C37.118)

For further and detailed configuration settings of the MRI card please look at chapter 9.1.10 - "Web GUI → Clock → MRS Settings".
9.1.11.3 IMS-ESI (Extended Synchronization Interface)

The ESI (External Synchronization Input) card is capable of adding additional synchronization sources to an IMS system. It accepts E1 or T1 signals, both as framed signals (2.048MBit/s/1.544MBit/s, supporting SS-M/BOC) or clock inputs.

The clock inputs are configurable (1 kHz - 20 MHz). Furthermore a 1PPS input is provided as well.

An ESI card is, as the MRI card, dedicated to one specific clock module (depending on the slot it is installed in) and can be installed in both ESI as well as MRI slots.

**Extended reference input signals**
- 1PPS, BNC
- var. frequencies (1 kHz - 20 MHz) unframed, BNC
- var. frequencies (1 kHz - 20 MHz) unframed, RJ45
- BITS E1/T1 framed, RJ45

**Hint:**
If the specified frequency range is exceeded, an error message is displayed in the web interface and the entered value is not accepted in this case.

**Input 1:** The input 1 is dedicated to 1PPS pulse synchronization.

![Input Configuration](image)

**Type** – PPS in
Input 2: The input 2 accepts as input either 2048/1544 kHz frequency or configurable frequency in range between 1 kHz and 20 MHz, also 1.544kHz if required.

Type: Frequency input

Frequency: 1 kHz – 20 MHz of input signal, 2048 kHz is set as default.

Maximum Slip: A discontinuity of an integer number of cycles in the measured carrier phase resulting from a temporary loss of input signal. The maximum slip number can be selected in range between 0.5 – 3 cycles, with 1.5 as a default value.

Input 3:
See Input 2, but with RJ45 Connector and as default Frequency input 2048 kHz.
**Input 4:** As fixed frequency you can choose between E1 framed and T1 framed.

**Type:** BITS in.

**Fixed Frequency:** E1 framed (2.048 MHz), T1 framed (1.544 MHz).

**Quality:** Synchronization Status Messages (SSM), Bit-Oriented Code (BOC).

**Sa Bits Group:** Location of transmitted SSM/BOC

**Quality Maximum SSM / Maximum BOC** (quality levels for T1 framed signal)

Synchronization Status Message (SSM) in accordance with ITU G.704-1998 standard includes 4 bit long SSM quality messages received via incoming E1 framed signal. The lower is the bit sequence the higher is quality of the source clock. The clock source quality levels according to G.704-1998 are as follows:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>QL-STU/UKN: Quality unknown</td>
</tr>
<tr>
<td>0001</td>
<td>QL-PRS: Primary Reference Source</td>
</tr>
<tr>
<td>0010</td>
<td>QL-PRC: Primary Reference Clock</td>
</tr>
<tr>
<td>0011</td>
<td>QL-INV3: not used</td>
</tr>
<tr>
<td>0100</td>
<td>QL-SSU-A/TNC: Synchronization Supply Unit A or Transit Node Clock</td>
</tr>
<tr>

<td>QL-PROV: Provisionable by the Network Operator</td>
</tr>
<tr>
<td>1111</td>
<td>QL-DNU/DUS: Do not use for synchronization</td>
</tr>
</tbody>
</table>

With the Quality Selection box, you can select the Minimum SSM level of the incoming signal that is still acceptable as input signal. If clock reports a lower quality level than the configured minimum SSM level the system will not use it for synchronization.
Example:
User configured QL-SSU-B as Minimum QL for his system. An E1 input signal reporting either QL-SSU-A or QL-PRC will be allowed for synchronization, whereas a signal with quality level QL-EEC1/SEC will not be accepted.

Sa Bits Group
Here you can select between the Sa4 to Sa8 bit group to choose the location for SSM quality bits.

9.1.11.4 Output Configuration

9.1.11.5 IMS BPE

BPE (Basic Port Expansion)
The BPE is a passive card, that provides the signals, which are generated by the reference clock. The customer can choose between different physical connectors and signal levels.

The BPE is pre-configured with the following signals:

- 1PPS, 10 MHz TTL
- 2048 kHz
- Programmable Pulses, provided by clock module
- IRIG DCLS+AM (B, AFNOR, IEEE1344 / C37.118)

There are no other configuration settings for a BPE card in the I/O Chapter. For further detailed settings on output signals of the BPE card please proceed to the Clock Configuration Chapter 9.1.10.
9.1.11.6 IMS CPE

This module consists of a half-size standard controller card (Back-End) and a dockable port expander card (Front-End), allowing a large variety of available and programmable output signals and physical connectors, including various electrical and optical interfaces.

IMS – CPE available Signals:

- 1PPS, 10 MHz
- Time Codes: IRIG A/B/E/G/AFNOR/IEEE1344/C37.118/NASA36
- Frequency Synthesizer (sine- wave + TTL)
- Programmable Pulses: 1PPS, 1PPM, 1PPH, Timer. Single Shot
- Cyclic Pulses; DCF77 Mark, Sync Status
- Serial Timestrings (RS232 or RS 422 / 485)

Selectable Modes:

**Idle Mode**  
Selecting "Idle" deactivates the output.

**Timer Mode**  
This mode simulates a programmable day assigned timer. Three turn-off and turn-on times are programmable for each output. If you want to program a switch time, change the turn-on time "On time" and the corresponding turn-off time "Off time".

A turn-on time later than the turn-off time would cause a switch program running over midnight. For example a program "On time" 10:45:00, "Off time" 9:30:00 would cause an active output from 10:45 to 9:30 (the next day!). If one or more of the three switching times are unused just enter the same time into the values "On time" and "Off time". In this case the switch time does not affect the output.

**Single Shot Modus**  
Selecting Single Shot generates a single pulse of defined length once per day. You can enter the time when the pulse is generated with the "Time" value. The value "Length" determines the pulse duration. The pulse duration can vary from 10 msec to 10 sec in steps of 10 msec.

**Cyclic Pulse mode**  
generating of periodically repeated pulses
The value of "Cycle" determines the time between two consecutive pulses. This cycle time must be entered as hours, minutes and seconds. The pulse train is synchronized at 0:00 o'clock local time, so the first pulse of a day always occurs at midnight. A cycle time of 2 seconds for example, would cause pulses at 0:00:00, 0:00:02, 0:00:04 etc. Basically it is possible to enter any cycle time between 0 and 24 hours, however usually a cycle times that cause a constant distance between all consecutive pulses make sense.

For example: a cycle time of 1 hour 45 minutes would cause a pulse every 6300 seconds (starting from 0 o'clock). The appearing distance between the last pulse of a day and the first pulse of the next day (0:00:00 o'clock) would be only 4500 sec. The value in entry field "Cycle" turns red, when entering a time that causes this asymmetry.

**Pulses**

Per Second, Per Min, Per Hour Modes
These modes generate pulses of defined length once per second, once per minute or once per hour. The value "Length" determines the pulse duration. The pulse duration can vary from 10 msec to 10 sec in steps of 10 msec.

**DCF77 Marks**

In "DCF77 Marks" mode the selected output simulates the telegram as transmitted by german time code transmitter DCF77. The generated time code is related to the local time zone. If you want DCF simulation to be disabled when the clock is in free running mode, you can enter the delay (given in minutes) for deactivating the DCF-Simulation with the "Timeout" value. DCF Simulation is never suspended, if the delay value is zero.

**Submenu Common:**

**Time Zone** - Choose local timezone
Submenu Synthesizer:

**Frequency**

1/8 Hz to 10 kHz: Phase synchronous to pulse per second  
10 kHz to 10 MHz: deviation of frequency < 0.0047 Hz

**Phase**

Edit the frequency and phase to be generated by the on-board synthesizer. Frequencies from 1/8 Hz up to 10 MHz can be entered using four digits and a range. If frequency is set to 0 the synthesizer is disabled. With “Phase” it is possible to enter the phase of the generated frequency from -360° to +360° with a resolution of 0.1°. Increasing the phase lets the signal come out later. Phase affects frequencies less than 10.00 kHz only!

**IRIG Out**

**IRIG Output Code**

Output code which is distribute in the system to all cards.

**Time Scale**

UTC or local time.
9.11.17 IMS - LIU (Line Interface Unit)

E1/T1 – generator available with 4 or 8 outputs
Generation of reference clocks for synchronization tasks. The module LIU (Line Interface Unit) generates different reference clock pulses which are derived from the GPS-locked master oscillator of a preconnected GPS clock. The output signals are available with high accuracy and stability therefore.

Submenu Output 1:

Output Type

Clock Outputs: 2.048 MHz (E1-mode) or 1.544 MHz (T1-mode), G.703, 75 Ohm, unbalanced or 2.048 MHz (E1-mode) or 1.544 MHz (T1-mode), G.703, 120 Ohm, balanced.

BITs framed outputs with SSM/BOC support:

2.048 Mbit/s (E1-mode) or 1.544 Mbit/s (T1-mode), 75 Ohm unbalanced or 2.048 Mbps (E1-mode) or 1.544 Mbit/s (T1-mode), 120 Ohm, balanced.

Format

E1 framed (2.048 kBit) or T1 framed (1.544 kBit)

Quality

Sa Bit group location of SSM QL bits

With the pull-down menu “Output Configuration” the available outputs of the I/O slots can be configured:

Output Configuration of a LIU module (Line Interface Unit):
In this menu one can select between E1 or T1 mode for the LIU outputs. The selected mode is the same for all outputs.

T1 or E1?

T1 is a digital carrier signal that transmits the DS - 1 signal. It has a data rate of about 1.544 Mbit/second. It contains 24 digital channels and therefore requires a device that has a digital connection.

E1 is the European equivalent to T1. T1 is the North American term whereas E1 is a European term for digital transmission. The data rate of E1 is about 2 Mbit/second. It has 32 channels at the speed of 64 Kbit/second. 2 channels among 32 are already reserved.

One channel is used for signaling while the other is used for controlling. The difference between T1 and E1 lies in the number of channels here.
**Sa Bits**

ITU-T Recommendations allow for bits Sa4 to Sa8 to be used in specific point-to-point applications (e.g. transcoder equipment) within national borders.

The Sa4 bit may be used as a message-based data link for operation, maintenance and performance monitoring. The SSM Bit (Synchronization Status Message) can be selected in the Web GUI for clock quality information. Sa4 is selected as default.
9.1.11.8 IMS - SCG Studio Clock Generator

SCG-U - Word Clock Generator, unbalanced

This module is not only designed for our IMS series and generates various audio frequencies for studio applications. The SCG module can also operate in our 19-inch rackmount and 1U Multipac chassis.

- Programmable word clock rates: 24Hz – 12,888MHz
- reference inputs: 1PPS, 10MHz, serial timestring

Output Type: Studio Clock Out (Word Clock) or Digital Audio Out (DARS)

State: on or off

Base Frequency: 32kHz, 44.1kHz, 48kHz

Scale: possible scales depends on base frequency choose a base frequency and a scale to get the right frequency at output x

Example: Output 3 state Enabled base 48kHz, scale 1/8
Output 3 = Base-Frequency * Scale
48kHz * 1/8 = 6kHz on output 3
SCG-B - DARS Generator, balanced
The SCG-B is an additional card for generating 'Digital Audio Reference Signals' for studio applications. The 25pin D-Sub female connector provides four DARS outputs, which can be configured here in the IO Config menu.

Sample Configuration: SCG-B Output 1

In the menu "IO Configuration" you can set the output on DARS for every output of the SCG-B. The four available outputs can optionally be switched off.
9.1.11.9 IMS - VSG

The VSG is a video signal reference for Studio Equipment with four BNC female output connectors. The Module generates 1x bi-level sync (Black Burst), 1x Tri-Level Sync, 1 x video sync signals (H-Sync, V-Sync or LTC) and 1 x digital video output (DARS). The LANTIME Web Interface can be used for output signal configuration and to query the state of the VSG.

Functionality
The board is synchronized by an external 10MHz signal. It generates configurable video signals in different formats. The generated signals have a phase reference to 1PPS.

Generated Signals:

**SMPTE standards:**
- PAL Blackburst with VITC-Support
- NTSC Blackburst

**Vertical Interval TimeCode**
The Vertical Interval TimeCode (VITC) is a time coding with time stamp (time code) for magnetic tape recording.

**Tri Level Sync:**
- 720p/50Hz (SMPTE296M3)
- 1080i/50Hz (SMPTE274M6)
- 720p/59.94Hz (SMPTE296M1)
- 1080i/29.97Hz (SMPTE274M7)

**V-, H-, Frame-Sync for HD and SD formats**
(VSG FW \(≤2.05\))

**LTC (25 fps) (VSG FW ≥2.06)**

**Digital Audio Signal:**
- DARS (AES3id via BNC 75Ω)
Output Type: Video Out or DARS

Epoch: start epoch of first frame

Format: Out1 supports HD formats only: 720p/50Hz (SMPTE296M3), 1080i/25Hz (SMPTE274M6), 20p/59.94Hz, 1080i/29.97Hz (SMPTE274M7)

Out2 supports SD Formats only: PAL, NTSC

Phase-Offset: Phase offset in 10ns steps (range: -32768ns...32767ns)
### 9.11.10 IMS - LNO (Low Phase Noise Option)

The IMS-LNO is a 10MHz generator card, which provides 10MHz sine signals with low phase noise to 4 external outputs. The card has a microprocessor system, which monitors the output signals and generates status signals for the upper-level management system accordingly. It can be used in our modular IMS Systems and also be applied in M900 timeserver platform and GPS based 3U housing, but without management functions.

The card has a high quality oscillator, which is locked to an external 10MHz signal. The microprocessor monitors the lock status of the PLL and the warm up phase of the oscillator. It activates the outputs only after the phase is locked. This condition is signalized by the LEDs. In the phase locked state, the output levels of the four outputs are monitored, and in case of a failure signalized by an associated LED.

*Output can not be active, before PLL is locked.*
9.1.11.11 Other Output Modules

Network Cards:

LNE
The LNE card adds additional network interfaces to the management CPU, increasing the number of NTP and management ports available.

The additional ports can be used to separate network traffic on physical network segments. For further configuration options please see the chapter "9.1.2".

For further detailed configuration settings for this card please see chapter 9.1.2, "Web GUI → Network menu".

TSU - IEEE 1588 Time Stamp Unit
The Meinberg time stamping unit provides a future-proof platform for your IEEE 1588 / SyncE / Carrier Grade NTP infrastructure. The high-power dual-core processor, the 1-step master clock and the 1GE interface with SFP slot supports a large number of PTP clients.

The ability to select Master and Slave operation for either Default, Power, Telecom or SMPTE profile makes this product the most flexible PTP solution on the market, suitable for a wide range of applications.

A lot of IEEE 1588 slave devices or NTP clients from different market segments can be synchronized, even over IPv6 networks, for example eNodeB’s for LTE base stations, Linux servers with hardware-assisted time stamping support for high-frequency trading applications, IEEE 1588 compatible IEDs in Smart Grid environments or IP-interconnected Audio / Video devices in broadcast studios.

The Synchronous Ethernet function provides a high accurate frequency transport over Ethernet networks. The card can be used either to take a SyncE signal from the network as a source or generate SyncE as a Master.

For further information on PTP features and detailed configuration for this card please proceed to Chapter 9.1.6, "Web GUI → PTP menu".
9.1.11.12 IMS Input/Output Cards

9.1.11.13 PIO - PPS/10MHz Input/Output Module

The PIO module is pre-configured by a jumper. The default configuration of all ports is PPS (Pulse Per Second). If this pre-configuration needs to be changed to 10MHz, the card must be removed and the jumper position adjusted.

Via the web interface, each port can be set separately to "Input" or "Output". If a port is set to "Output", the system PPS or the 10 MHz reference frequency is output signal at this port. If a port is set to "Input" the incoming signal is compared to the system PPS or to the 10MHz reference frequency. The offset values are displayed in the status window.
9.1.12 Sync Monitoring

9.1.12.1 Sync Monitoring Introduction

The Sync Monitoring feature is used for measuring, monitoring and reporting of network nodes’ accuracy against a UTC traceable source (e.g. GPS, multi-GNSS or national timing service, e.g. NPL). The Sync Monitoring node can monitor nodes synchronized by network protocols PTP (IEEE 1588v2) or NTP (RFC1305).

PTP nodes need to support the Meinberg TLV approach or standard PTPv2 Management messages, otherwise they cannot be monitored. NTP nodes can only be monitored if they are configured to respond to NTP client requests (Note: A NTP client that is using the Windows Time Service W32Time does not respond to NTP client requests per default configuration. W32Time needs to configured to act as client and server at the same time. Otherwise the node cannot be monitored via SyncMon).

However, also all configured MRS, FDM, PIO and ESI inputs (like PPS and Freq inputs) can be monitored if an ESI (Extension Signal Input) card is available. The Sync Monitor feature is now available on Meinberg IMS Systems with firmware version 7.00 or later and for PTP monitoring with integrated HPS-100 PTP card with a minimum 1024 client performance license.

The Sync Monitor can run either as a node independent from a master clock. In this case a Sync Monitor node can be located basically anywhere in the network; but most probably as close as possible to the slaves to be able to measure their actual accuracy. At the same time you can monitor also the performance of a GM and measure the potential network asymmetry which is present in the link between a GM and the Sync Monitoring Node.

It is possible to configure up to 1000 nodes for monitoring in the Sync Monitoring interface running on a standard LANTIME or IMS System. You can specify monitoring and logging intervals for each individual node separately. Besides, an offset limit can be configured for each node which triggers an alarm notification (via SNMP, email, relay output or a user defined channel) if the limit for this particular node is exceeded. For NTP nodes you can define also a stratum limit, which can also trigger an alarming when the defined limit is exceeded.

Moreover, for each node it is possible to download all the monitoring data and its log files which can be used to generate a report or for further statistical analysis. Data of each monitored node can be sent online via SYSLOG protocol with different formats or activate an ‘rsync’ service to copy measured data to external data server. Online Data of each node can be read via WEB service like ‘curl’ or ‘wget’ in JSON format to use current data in other management systems.

A JSON file for each node is available under: /www/htdocs/syncmon/[alias].json where [alias] is a placeholder for the Node-Alias.
9.1.12.2 Sync Monitor first steps

When starting SyncMon the first time no monitoring is activated. To activate monitoring at least one node has to be added. Press the button "Add Member" to add a new monitoring node.

9.1.12.3 Sync Monitor Status and Configuration via WEB Interface

![Node Monitoring Table](image)

Figure: Sync Monitor user interface on LANTIME systems with a FW 7.00 or later.

The "Node Monitoring" will show the current status and configuration of all monitored nodes. A monitoring node can be either a device in the network like NTP servers or PTP devices or an Lantime specific input module for e.g. Pulses or frequencies. Each line in the table represent a monitored node or a group of nodes. The table can be displayed in flat or group mode. In flat mode only nodes will be displayed in a line. To structure the table the group mode can be selected by pressing the "Grp" button on top of the first column – then all nodes with the same group number will be gathered to one line and can be opened separately.

The status on the WEB interface will be updated automatically every 10s. In the Sync Monitor Status and Configuration dialogue you can add new members for measuring their accuracy and monitoring their sync performance. By selecting a "+ Add Node" button you will proceed to an enter configuration dialog in order to add a new node for monitoring.

"Refresh Nodes" Button:
This can be used to get an overview of the current values just at that moment even if the request interval is higher. All configured nodes will be refreshed. A new measurement will be done and status in table of nodes will be updated. The refreshed value will be added to the list of measured values to calculate the median value. No measurement will be done on all HPS cards using PTP.
The features in the "Add Node" configuration dialog depend on the input selection of the first parameter "Monitoring via" and offer different input masks with different options:

**Monitoring via:**
Select a monitoring instance from the drop down list. The drop down list appears differently in different HW configurations. The following options are available:

**Main CPU:**
This monitoring instance is always available and is not dependent on HW configuration of the LANTIME system. It can monitor native NTP nodes only, which are responding to NTP client requests (Note: A NTP client that is using the Windows Time Service W32Time does not respond to NTP client requests per default configuration. W32Time needs to configured to act as client and server at the same time. Otherwise the node cannot be monitored via SyncMon). All assigned interfaces can be monitored at the same time or you can select a particular interface from a list if available.

**External**
**SyncMon:** This monitoring instance can monitor nodes and sensors of other Lantime devices with activated SyncMon. When selecting the external SyncMon with IP address a list of available nodes from that external SyncMon will be downloaded. Configuration and data will be transferred via WEB service (curl).

**HPS:** HPS100 cards can be used for monitoring PTP or NTP on its own network port.

If HPS is configured (see Lantime PTP configuration) as PTP slave then the HPS card will behave like a standard PTP Slave with all its options like Profiles and network specific configurations - but only one PTP Master can be monitored at the same time with the HPS card. If HPS is configured (see Lantime PTP configuration) as monitoring device (this is only possible if HPS has a 1024 clients license at minimum) then multiple PTP nodes can be monitored with the network port of the HPS card. Then that monitoring instance can monitor PTP nodes, supporting protocols PTP with TLV (proprietary for a Meinberg Sync Node), PTP with MGMT (defined in the IEEE 1588v2 standard) and NTP with software time stamping. The special protocol "PTP with TLV" is like a reverse PTP: a PTP delay request packet with a special TLV will be send to the PTP device and this will answer with a sync packet and a delay response packet – this method allow measuring the offset from the internal reference to the PTP device even if the PTP device is in Master, Slave or Passive mode.
Statistic Types:

A: HPS in PTPv2 Operating Mode.
B: HPS in Monitoring Mode.
C: HPS in NTP Mode.

ESI: This monitoring instance can monitor PPS and Freq nodes with Extension Signal Input (ESI) card. From a drop down list you can select which particular signal you wish to monitor. Options available are: PPS0, Freq In0, Freq In1, BITS In2.

MRS-CLK: This monitoring instance can monitor all activated MRS/XMR input signals for each MRS-reference clock. From a dropdown list you can select which signal you want to monitor. Options available are: GNSS/ GPS, NTP, PTP, PPS, IRIG, 10MHz, E1, 2048kHz, - (depending on HW options (see ‘Clock’ tab in the Web interface).

PIO: This monitoring instance can monitor PPS and Freq nodes with Programmable Input Output (PIO) card. From a drop down list you can select which particular signal you wish to monitor. This depends on the configuration of the PIO card. Options available are: PPS0, PPS1, PPS2, PPS3, Freq In0, Freq In1, Freq In2, Freq In3.

FDM: This monitoring instance can monitor 50/60Hz power line networks nodes with Frequency Deviation Monitor (FDM) card. From a drop down list you can select which particular signal you wish to monitor. Options available are: time deviation or frequency deviation.
Address (IP4/6 or MAC):
IPv4 or IPv6 or MAC address of a node you want to monitor over the network. Host names are not allowed.

Alias:
Alias name for a monitoring node to find it easily in the complete table overview. The alias name which is
configured by the user will define the name of the directory on flash disc (‘Base Path for logfiles for history of
days’) of each node. The alias name has to be unique and one word without blanks with a maximum length of
63 characters (blanks will be converted to ‘_’ automatically). It is possible to monitor the same node (e.g. the
same IP-address) with different alias names – this may be useful if you want to monitor the same node from
different monitoring modules (e.g. different HPS100 IMS cards with separate network paths).

Location:
Enter a physical location of a monitoring node for you to recognize this node easily in the complete table.
The location name has to be one word without blanks with a maximum length of 63 characters (blanks will be
converted to ‘_’ automatically).

Group Index:
You can group monitored nodes within a logical group by assigning them the same index, (e.g. nodes with the
same group index may be of the same kind (NTP, PTP, PPS), or at the same location, etc.). Nodes with the
same group index will be sorted automatically in the table. The table can be displayed in flat or group mode.
In flat mode only nodes will be displayed in a line. To structure the table the group mode can be selected
by pressing the “Grp” button on top of the first column – then all nodes with the same group number will be
gathered to one line and can be opened separately.

Request Interval (s):
Interval in seconds by which a monitoring node sends monitoring requests to the slaves / clients. The min
request interval is 1s, the max is 3600s. A default interval is 64s. If the Request Interval is disabled (0) then
no requests will be sent to the nodes and no data will be logged.

Logging Interval (s):
Interval in seconds by which the measured offset and stratum are written to a logfile. If the log-interval is disa-
bled then no data will be stored to the logfile. If the request interval has been activated and the log-interval
has been disabled then the nodes will be monitored and limits and notifications will be checked but no data
will be stored. If the Request Interval is lower than the Logging Interval then the mean value of the measured
offsets at request interval will be logged and the Minimum and Maximum values in the log-interval will be
stored additionally.

Disable Monitoring:
Monitoring can be disabled for each node. If Node has been disabled then no monitoring Data will be send to
the Node and no data will be saved.

Disable Logging on external Server:
The measured or logged data can be send via SYSLOG or RSYNC protocol to an external server. This can be
disabled for each node (see System settings for external Server Configuration).

External SyncMon:
"External SyncMon" is a special monitoring instance that can monitor nodes and sensors of other Lantime de-
tices with activated SyncMon. When selecting the external SyncMon with IP address a list of available nodes
from that external SyncMon will be downloaded. Configuration and data will be transferred via WEB service
(curl).
Press "Connect to external SyncMon" will try to connect to the external SyncMon and show the SSL-Fingerprint of that server. Check the following ssl-fingerprints received from external SyncMon. The SSL certificates will be used by curl when https is active. To check the fingerprints open a SSH session on the external SyncMon and compare the output of: "openssl x509 -noout -fingerprint -sha256 -inform pem -in /etc/https.pem". This is to make sure that this is the correct device.

Then configure Username and Password to read Config from external SyncMon – the current configuration of external SyncMon will be read via 'curl'. Also you have to configure the WEB access protocol (HTTP or HTTPS) and if you want to use a CA Certificate Bundle to get configuration and measured data from the external SyncMon.

Be aware that if you use HTTPS that all data has to be encrypted and decrypted which costs a lot of CPU-UTILIZATION for each data requesting from the external SyncMon.

Be aware if you want to use HTTP access protocol then you have to activate HTTP network service on the internal and external Lantime. The same is with the HTTPS protocol.
Getting the current configuration from the external SyncMon you have to choose the nodes which you want to monitor of that Lantime. Only nodes will be offered which are not disabled and not disabled for external logging. The parameters for request and log interval will be taken over from the external configuration. Location and the Group index can be configured for all selected nodes. The default Location will be "SyncMon-" plus the IP address. The Alias names for the external SyncMon nodes will be the original Alias-name plus "@IP-address". It is recommended to use a non-used Group ID for all nodes of an external SyncMon.
If changes will be done on that nodes of external SyncMon configuration which will be monitored then a warning sign will be displayed in the main table in the Event column for that node. Then you have to change parameters manually for that node.

Event Configuration:

**Offset Limit (s):**
Offset threshold value in seconds. The measured offset between a node and the reference will be compared to the configured threshold. If the calculated difference is higher than the configured offset limit the LANTIME will generate an alarm “Sync Monitor” (which can be sent as a notification eMail, SNMP trap or to an external syslog server). With the "Trigger" option can be choose the direction “Trigger if Limit Exceeded” or "Trigger if Below Limit”. With the option "Offset Limit [s] Trigger Counter" the Event will be triggered once after number of limit exceeded in a row.

**Stratum Limit:**
Threshold value for a NTP stratum level. If the stratum level of a monitored client is higher than the configured stratum limit, it will generate an alarm (sent by eMail, SNMP trap or to an external syslog server). With the option “Stratum Limit Trigger Counter” the Event will be triggered once after number of limit exceeded in a row.

**Not Reachable Event:**
If configured Node is not reachable for monitoring then LANTIME will generate an alarm “Sync Monitor” (which can be sent as a notification eMail, SNMP trap or to an external syslog server). With this option this can be enabled or disabled. With the option "Not reachable Limit Trigger Counter" the Event will be triggered once after number of not reachable exceeded in a row.
Symmetric Key Configuration:

Symmetric Key Index:
If you want to use symmetric key authentication for SyncMon then select a key index from the list of already applied keys. If the keys are not yet defined, proceed to the NTP dialog in the “Web GUI → NTP → Symmetric Keys” and generate a new key file, which should be stored and activated on the monitored node as well. For more information about Symmetric Key Generation please proceed to LTOS7 Configuration “Web GUI → NTP → NTP Symmetric Keys”.

Asymmetry Offset for Graphic:
If a constant asymmetry of the measured nodes is known then you can set this value for the graphical output – the logged values will not be modified - the asymmetry offset is like a fix offset for graphic monitoring only.

Hide Min/Max/MTie filled curves in Graphic:
If the request-interval is lower than the log-interval additional values for Min and Max will be stored in the logfiles. These Min/Max values will be displayed as a filled curve in a gray color behind the logged offset curve. This feature can be disabled.

Hide this Node in SyncMap:
You can disable a specific node in the SyncMap.

When you are finished with configuration of a new monitored node, save the current configuration by clicking the “Save Member” button. By clicking the “Remove Member” button you will remove the currently selected node from the complete list of all monitored nodes. All sampled data for the particular node will be lost if you did not back-up the saved data prior its removal.

By clicking the “Remove Existing Data” button all data for only this specific node will be erased.
9.1.12.4 Scan for New Nodes

Scan for new Nodes is an automatic search for NTP and PTP nodes within your network. Scan for PTP nodes will be supported by HPS card only with 1024 clients license and monitoring activated.

![Scan for Nodes dialog](image)

**Figure:** Scan for new Nodes dialog. Only newly found nodes will appear in this temporary table. Select nodes which you wish to add in the overall monitoring node table.

**Search via:**
First select an instance from a drop-down list to use for searching of new nodes. Possible options are "Main CPU" and "HPS" card. With the Main CPU you can search for NTP nodes only. Scan for PTP nodes will be supported by HPS card only with 1024 clients license and monitoring activated.

**First IP address to scan:**
Set the starting IP Address where the search will start with the automatic NTP scan. In the drop-down list you will find all sub net ranges of each network interface. With "Manual IP address entry" an other start point can be defined.

**Number of IP Address to scan:**
This parameter will set a number of IP-addresses which will be scanned. To each IP address from the IP-Range a separate NTP packet request will be sent. If a NTP client answers to this request and its IP address has not yet been configured then this node will appear in the table. With "Manual IP range entry" an other size of the range can be defined.

**Scan for NTP Nodes via Main CPU:**
Starting "Scan for Nodes" will send one NTP request (UDP on port 123) to each configured IP address (IP address range) and wait for an answer.

All answers will be displayed in a table and can be added to the list of monitored nodes. With select-boxes new nodes can be added automatically to the list of the monitored nodes. The parameters for Location, Group Index, Request Interval, Logging Interval, Offset Limit and Stratum Limit can be defined at the next step, before adding them in the table with other monitored nodes.

**Search via HPS:**
If a HPS card in monitoring mode (supported by HPS card only with 1024 clients license and monitoring activated) is selected then the "PTP Domain" has to be set up.
Figure: To scan the network for PTP nodes a HPS card with activated monitoring has to be selected first in the Search for Nodes drop-down list.

PTP Domain:
The network connected to that HPS card will be scanned in the domain, which was defined here by user. The following mappings as defined in IEEE 1588-2008 will be scanned:

- UDP/IPv4/Ethernet,
- UDP/IPv6/Ethernet,
- Ethernet (IEEE 802.3, layer 2).

When starting the scan first a PTP Management message will be sent in broadcast mode to get the "port state" of each PTP node - this will be done with IPv4, IPv6 and Layer2.

All PTP nodes which answer to this request will ask for the "current status" and "clock status" with management messages that follow. The result will be displayed as a list of all available PTP nodes. Each new PTP Node will be entered in an overview table of the available nodes.

Only new nodes which have not yet been configured will be shown in the table. For each node the PTP-UUID, MAC-Address, IP-Address, Vendor name, Feature (if a node supports PTP with extended TLV for monitoring or PTP management messages only), Domain number, Status (the current PTP status like Slave, Master, Listening . . . ), Offset and Delay (current measured values from PTP management message) will be automatically displayed in the table. With select-boxes new nodes can be added automatically to the list of the monitored nodes. The parameters for Location, Group Index, Request Interval, Logging Interval, Offset Limit and Stratum Limit can be defined in the next step before adding the selected nodes.
The monitoring engine will start to send PTP/NTP requests in the configured intervals to each node from the list and measure the time received in the responses with its own time (which is traceable to UTC, GNSS sync for example). The current offset and status information can be checked in the status overview table in the Node Monitoring menu.

In the status overview table of monitored nodes, next to the status information you will find 3 action buttons: Graph, Error Logs and Edit.

By selecting the Graph button a Graphical Diagram for the selected node will show up. At this page you find several features for different representation options.

Offsets are collected for each NTP/PTP or other monitored node and can be depicted as graphical representation for selectable time intervals in the web UI of the SyncMon node.

The monitored data are continuously saved on the Sync node ‘Base Path for logfiles for current day’ and will be saved automatically to the Flash Card (‘Base Path for logfiles for history of days’) at change of a day at 0:00 UTC. Data are available at any time for further statistic processing.

At the bottom of the graph an overview will show which color will represent which data. In this case the red line represents the internal NTP Offset, which is the reference for the monitored NTP node. The green line is the offset between a Sync node reference time and the measured time of a monitored device.

By positioning the cursor to one item in the bottom line then only that graph will be displayed and all other graphs will be shown in light color. When clicking to one item in the bottom line then this graph will be hid.
For PTP and PPS signals, the sync node reference is an internal reference time from the receiver (e.g. multi GNSS (GPS, GLONASS, Galileo, Beidou), external UTC time service, IRIG TC, long wave time reference: eg. PZF, MSF, WWVB . . . ). The sync node reference is depicted as a red line and if a second reference is available then the blue line represents the offset between the two reference clocks. For multi GNSS reference clock in normal operation you will see something in the lower nano second range with 5ns resolution.

For NTP monitored signal the Sync node is synchronized the internal NTP that is in sync by an internal reference clock (multi GNSS or IRIG TC, long wave . . .). In this case the red line in the graph represents the internal NTP system time.

**Time Range:**
There are different time ranges to choose from. By day, week, month and custom. When selecting the custom time range click on "Apply" to display the graph with the selected time range. For other options it is also possible to go back to see data in the past.

**Y Range:**
Different options available: auto-scale, or fixed Y ranges in decade intervals: 100ns, 1us, 10us, 100us, 1ms, 10ms and 100ms.

**Update Interval:**
Automatically update of the current graph can be activated from 1s up to 1 hour.

For NTP nodes it is possible to view a graph either as raw data or with applied Median Filter or a graph of the internal reference only (the red line).

For PTP nodes, selected graph modes are **Reported offset from a PTP node** (data obtained from a PTP node by a standard MGMT protocol).

**Measured offset to a PTP node** (offset of a PTP slave measured against the internal reference). The measurements are available only for PTP nodes which support monitoring PTP protocol with TLVs. The monitored node can be in Slave, Master or Passive mode. Along with the measured values obtained by reverse PTP, also reported value curve is available and MTIE filled curve if MIN and MAX value measurement is supported on the monitored node.
For PPS nodes monitored via an ESI or PIO input card at the Sync node, you will have the graph modes available: raw data, data with applied Median Filter and Internal Reference only (a PPS from an internal reference clock.)

If the request-interval is less than the log-interval then additional Min–Max values for that log-interval will be stored in the data files. These Min–Max values will be added automatically as a filled curve in the graphical diagram and the mean value will be shown as red line in that filled Min/Max curve.

**Zoom X/Y-Range:**
To zoom in and out the Y-Range position the mouse cursor on the Y-axis and scroll with the mouse wheel to zoom in and out. When pressing the mouse button once on the Y-axis this will be reset to the selected Y-Range. When pressing the mouse button and moving the mouse up and down the Y-axis will be moved up and down.

To zoom in and out the X-Range (time line) position the mouse cursor in the graph and scroll with the mouse wheel to zoom in and out. When pressing the mouse button and moving the mouse left and right the graph will be moved left and right. By moving the mouse over the graph an info view will show all values of all graphs.
Show Data:
With the Button "Show Data" you can swap the graphic to a table view of the current displayed values. The first line will show the description of each column. With the "Show Graph" button you can go back to the graphical view. If zoomed in then data will be shown of the zoomed time range only.

JSON URL:
With the button "JSON URL" you will get the WEB address to receive the last measured value of the selected node. This can be used to read the current values via WEB access (wget or curl) from an external program. The JSON format is as follows:

```
{
    "SyncMon_Data": {
        "LastLogValues": {
            "NodeName": "172.27.100.57",
            "OffsetLimit": 0.000000000,
            "RawOffset": -0.000050076,
            "MedianOffset": -0.000048733,
            "PathDelay": -0.000002693,
            "Status": 1,
            "LastErrorCode": 0,
            "LastConfigChange": 0,
            "LogTime": 1559025024
        }
    }
}
```

Edit Button:
With the "Edit" button all graphical parameters can be viewed and be configured. The Asymmetry Offset can be used to adjust the graph with a fix offset (to compensate a known asymmetry in a network or a running time of a cable length).
Export Button:
With the "Export" button a PNG file of the current graph will be generated. This can be used for printing and saving.

Generate Report Button:
With this selection the current data of the monitored node will be prepared in a form of a report. You can also select a time frame for sampled data from which a report will be generated. The report includes the current status data, monitor configuration, monitoring statistical values over the selected time frame, a graphical diagram and optional a full sync map related to the monitored node.

Figure: Generated report for a selected node. The report includes a status information of the selected monitored nodes, monitor configuration, main monitor statistics and graphical diagrams.

"Back" button in Graph view:
When choosing the graphic page the 'Back' button will go back to the main table view and showing the table with all configured nodes. In case of sensors the table of sensors will be opened automatically.
Error Logs:
Back in the main Sync Mon menu, by selecting the Error Logs button you will enter the Error Logs page of the selected monitored node. At this page the log messages are shown since the last system reboot. When the flash memory card gets full, the older logs will be overwritten.

Figure: Error Log Messages for a selected monitored node.

At the bottom of the page there is a button "Show Global Error Logs" by which you can switch to view all Error Messages coming from all monitored nodes.

With "Clear Error Logs" all log entries will be removed. With "Error Log Statistics" an overview of logs of all nodes will be displayed.
9.1.12.5 Events

In the general overview table the last column Events is dedicated to different alarms, which are defined for monitored nodes:

- Offset limit exceeded
- not reachable
- Stratum limit exceeded
- monitoring not active

In case of "Offset Limit exceeded" and "not reachable" an icon with the count of events will be shown in the table of monitored nodes in the Events column. These events will be updated automatically every 10s. With the "Reset Events" button which can be found above the overview table you can reset the current counter for the events. These events are shown also in the SyncMap.
9.1.12.6 Actions for selected Nodes

In the firmware version 7.00 and following you are able to apply given actions at the same time to a number of selected nodes from the table. First select the nodes which you wish to manage, either by clicking individually a check box at the beginning of each node or by clicking on a "+" sign in the top row of the table if you wish to select all nodes together.

To deselect a node which has been selected, either click again into its check box and it will be deselected or click the "-" icon in the top row and you will deselect all nodes at the same time.

If you click the button "Actions for selected nodes" you will find actions which you can apply over the nodes.

Select all "not reachable" nodes:
Selection of all nodes, whose offset status shows "not reachable".

Select all NTP nodes:
Selection of all nodes, which are monitored via NTP.

Select all PTP nodes:
Selection of all nodes, which are monitored via PTP, either MGMT or with TLV messages.

Sort nodes by Group ID:
The full list of nodes will be sorted by Group ID

Show overview of the current day:
If none of nodes has been primarily selected than graphical diagrams of the current day will be shown in a thumbnail form for all nodes in the table. Along with the graphical diagrams also the status information and statistics over the current day measurements will be displayed.

Show overview of the time range:
If none of nodes has been primarily selected than graphical diagrams of the selected time range will be shown in a thumbnail form for all nodes in the table. Along with the graphical diagrams also the status information and statistics over the selected time range measurements will be displayed.

Show a Graphical Diagram for selected nodes (max 10):
If you select up to ten nodes in the table, they can be displayed in the same graphical diagram. First, you have to select a time frame in which the graphical diagram will be displayed.

Create a Report for selected nodes (max 5):
If you select up to five nodes in the table, the current data of the selected nodes will be prepared in a form of a report. First, you have to select a time frame for which the report will be generated. The report includes the current status data, monitor configuration, monitoring statistical values over the selected time frame and a graphical diagram which shows the offset trend.
Besides, the report also provides a light version of a sync map, which includes only the selected nodes from the table. In the sync map each individual node is highlighted and the rest are depicted in the background to get a comparison of how the given node is performing in relation to other nodes considered in the report.

![Sync Map Example]

**Figure**: Generated report for selected nodes in the table. The report includes a status information of the selected monitored nodes, monitor configuration, main monitor statistics and graphical diagrams.

**Disable measurements for selected nodes:**

The nodes for which you disable measurements will get a status “Disabled”. The measurements will no longer be requested and logged for this node. The latest measured offset will be shown in the Offset column. To start measurements again, select a node and choose **“Enable measurements for selected nodes”**.

**Set parameter for selected nodes:**

For the selected nodes you can set or edit a list of monitoring parameters at the same time. When you select this feature the configuration dialog will show up where you can re-configure any of the parameters. The new configuration will be applied to all the nodes you have selected for this action after you confirm with the **“Apply to Nodes”** button.

**Duplicate selected nodes:**

The nodes which you have selected will be copied and pasted below their origin nodes. Afterwards you can edit their parameters.

**Move selected nodes to the top of the list:**

The selected nodes will be moved to the top of the list.

**Move selected nodes to the bottom of the list:**

The selected nodes will be moved to the bottom of the list.

**Delete all data of selected nodes:**

The logged measurement data of the selected nodes will be permanently deleted from the internal flash.

**Delete selected nodes:**

The selected nodes will be permanently deleted from the list of nodes. The logged measurements up to this point will be preserved.
9.1.12.7 Meinberg Sync Map

The Meinberg SyncMap is a graphical representation of monitored nodes in a network visualized as a polar diagram. The idea of the SyncMap is to give a quick overview of the synchronization status of all monitored devices in a complex network structure.

The monitored devices are called nodes. Nodes have to support one of the following signals: NTP (RFC1305), PTP (IEEE 1588v2) or PPS connected to ESI (Extension Signal Input) IMS card.

The goal is to visualize an absolute offset of monitored nodes in terms of predefined offset limits. The data can be shown according to the current offset status or over a selectable time range (e.g. one day). It is also possible to animate the dynamic behavior of the monitored nodes of the last 60min, where SyncMaps are generated automatically every minute. This mode is called SyncMap Cyclic Mode.

Figure: The SyncMap as a graphical representation of the monitored nodes in a network visualized as a polar diagram. It can display nodes which support: NTP, PTP (IEEE 1588v2) or PPS signals.
Each monitored node will be represented as a circle with different statistical information.

![SyncMap Diagram]

**Figure:** A node representation in the SyncMap. The meaning of different color codes and parts which belong to a node are explained in the text.

The Time Monitor reference with its reference clock stands in the middle, labeled as the “Time Monitor” [1]. It provides a timing reference by a controlled oscillator (synchronized by GPS, GLN, PZF, Galileo, Beidou or an external clock supply). The Time Monitor node in the center [1] is shown in green color when the reference clock is synchronous. In addition the current offset between the controlled oscillator and the reference time source is shown as a value [1].

Around the center four concentric circles representing the scaling of the polar diagram are drawn. All nodes [3] are connected concentrically by a line [2] from the central node. The distance from the center to the nodes represents the absolute average time offset between the Time Monitor and each individual node. The average value is calculated over the selected “Time Range”. Each node is shown as a circle with a color inside [3] that corresponds the status and an outer ring [4], that corresponds its type.

**Status:**
- **green** = Offset < Limit
- **red** = Offset ≥ Limit or outside the maximum scaling

**Type:**
- **yellow** = NTP
- **dark blue** = PTP with TLV
- **light blue** = PTP with Management Msgs
- **green** = ESI PPS
- **grey** = not available

Additionally, the statistical values: the standard deviation [8] is represented as circle segments. These values represent the temporal jitter of the measured values around the mean value. When the circle segment color is red, then the deviation is dependent on the scaling and it exceeds the half of range of the decade → example: if the middle deviation is in the range 1μs - 10μs and the largest found maximum >5μs, then the individual segment is drawn red, otherwise blue [10].

If one of the events occur “Offset Limit Exceeded” or “not reachable” then the circle segment will become dark red and a white value which represents the count of each event. The circle slide near the center [5,7] represent the Events “not reachable” and the outer circle slide [6,7] represent the Events “Offset Limit Exceeded”.

While sliding with the mouse over a node in the SyncMap without clicking a corresponding info window with the name and some statistical values will be shown:

![ID 1 - PTP 172.27.101.218 TLV]

<table>
<thead>
<tr>
<th>Address:</th>
<th>172.27.101.218</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupID/Location:</td>
<td>0, M3000.27.101.11</td>
</tr>
<tr>
<td>Offset/StdDev:</td>
<td>500ms / 392μs</td>
</tr>
<tr>
<td>Offset Limit Exceeded:</td>
<td>0</td>
</tr>
<tr>
<td>NotReachable:</td>
<td>0</td>
</tr>
</tbody>
</table>
By selecting a specific node in the SyncMap with a left mouse click the following menu will be opened:

```
ID 1 - PTP_172.27.101.218_NI
Show Graphic
Reset Event Counter
Edit Node Parameters
Close this menu
```

"Show Graphic" will open the corresponding graphical diagram.

**Example of a full SyncMap**
The following picture shows a SyncMap of a network with 250 monitored NTP nodes running on a Sync Fire. This is a real measurement of our Test-Network for burn in tests in the Lantime production. The red signed nodes are DCF77 receivers with no compensation of the distance between a transmitter site and a receiver.

*Figure: An example of a Sync map with 250 nodes.*
Sync Map Type:

- Show reachable: currently reachable nodes are shown in the Sync Map.
- Show all Nodes: all nodes configured in the monitoring list are shown in the Sync Map, even unreachable ones.
- Show NTP only: only nodes which are monitored via NTP protocol are shown in the Sync Map. They will appear encircled with a yellow ring.
- Show PTP only: only nodes which are monitored via PTP protocol will be shown in the Sync Map. Nodes will appear with a dark blue ring if the PTP with TLV protocol is used for monitoring or with a light blue ring if the PTP protocol with Management Messages is used.

Time Range: the Sync Map can be generated using the monitoring data sampled in the past 30 min, past 5 min, in the past 24 hrs or within a manually selected time range. Also the statistical values are calculated using the data in the selected time interval respectively.

Scaling: possible scaling options: decade steps or linear for different time accuracy ranges. For PTP nodes it may be suitable to use scaling in lower microsecond range, whereas for NTP you can select ranges in a few 100microseconds or millisecond range.

Refresh Button: Immediately refreshes the Sync Map based on the currently available statistics of each single node. A new SyncMap with the selected time range will be generated - it is like a reload of this WEB page with the latest measurements.

Start Cyclic: will activate the SyncMap animation mode. In this mode every minute a new SyncMap with the latest measurements will be generated. The last 60 SyncMaps will be then displayed as an animation. A new sequence will start with a blank SyncMap. The statistics time range will be set by default to 5 min.

The number of PNGs stored in RAM is set to 1000 in auto refresh mode if a Q7 CPU or a Syncfire is in use.

Help Button: will show the online help page for a SyncMap feature.
A short legend:

1. The Time Monitor node and the current offset measured between its oscillator and the reference time. The color defines the sign of the average: yellow=negative blue=positive
2. Line connecting each node with the SyncMon. Its length represents the absolute average time offset between Reference of SyncMon and the node. A measured node, its color inside corresponds to its status.
3. Outer ring which corresponds the type of the node.
4. Event counter for "Node not reachable".
5. Event counter for "Node Offset Limit exceeded".
6. If Event counter > 0 then this slide is dark red. If Event counter = 0 the Standard Deviation is light red or light blue.
7. Standard deviation measurement. If light red, it exceeds the 100 percent of current offset, otherwise is blue.
9.1.12.9 System Monitoring

System Monitoring monitors other signals in the LANTIME system which do not belong to the monitored nodes (for example CPU-Utilization, local NTP, ESI inputs, MRS-References and Refclock parameters). The number and type of the internal signals depends on the integrated hardware components in a LANTIME system.

The System Monitoring is an optional feature and as per default it is disabled. It has to be enabled in the menu ‘SyncMon → System Settings’ in the System Parameters dialog.

If the System Monitoring is enabled, then all signals will be measured and logged automatically in the same way like Node Monitoring, namely System Monitoring page will be visible.

![System Monitoring Table]

Figure: An overview table for internal signals as shown in the System Monitoring page. The system signals you wish to monitor, need to be first selected in the Source Priority list for each reference clock individually.

The number of MRS References (CLK1-GPS-0, CLK1-NTP-1, CLK1-PTP-2 ...) depends on the activated Source Priorities for each reference clock – this can be configured on the “MRS-Settings” tab in the ‘Clock’ page for each clock.
9.1.12.10 Local NTP Counter

The LANTIME automatically counts all incoming network packets on UDP port 123 of all available network interfaces. This statistic is displayed graphically in the table "System Monitoring" under Local_NTP.Counter. The red line shows a value of the received NTP packets within a selected time period.
9.1.12.11 Error Logs

Global Error Log gives the option to track all error events.

**Error Log Statistics:**
- categorization of error logs for each specific node.

**Clear Error Logs:**
- deletes the list of logged errors.

---

Figure: Log Messages from all monitored nodes.

---

Figure: Error Log Statistics.
9.1.12.12 System Settings

The menu for “System Settings” will show the current available space on the flash disc and will calculate the count of days which can be stored depending on the count of monitored nodes and the log-interval.

<table>
<thead>
<tr>
<th>System Settings</th>
<th>20 nodes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monitored nodes</td>
<td>27 sensors</td>
</tr>
<tr>
<td>Data per day</td>
<td>16.47MB/day</td>
</tr>
<tr>
<td>Days until disk fail</td>
<td>68 days</td>
</tr>
<tr>
<td>Available disk space in '/data'</td>
<td>1.27GB</td>
</tr>
<tr>
<td>Used disk space in '/data'</td>
<td>1.93GB</td>
</tr>
</tbody>
</table>

Figure: Memory card status, available space left and logfiles archiving options.

There is an indicator implemented which informs about the available flash space “Available Space on Flash” and the number of days left for monitoring of the current sync node setup. The current data will be stored on the flash card.

With the button ‘Remove All Recorded Data’ all files on the flash storage belonging to SyncMon will be removed without a backup.

9.1.12.13 Send Monitoring Data to external SYSLOG Server as a Backup

In SyncMon Menu in the Web Interface menu “System Settings → External Syslog-Server Configuration” you can configure up to 3 external Servers, where the measured data is sent at each log interval via the SYSLOG protocol. On the external server has to run a service like a standard Syslog-Server.

In order to backup the monitoring data and store them for later analytical processing, you can enable automatic sending of the data via SYSLOG protocol to up to 3 external database servers. In this case every node measurement processed in a log-interval will be sent to a specified server.

In the following dialog you can configure the target servers where you want to store your data.

Figure: Configuration options for external database servers where the monitoring data can be stored.
For each of these external servers the following parameters can be set:

- network protocol: UDP or TCP
- a port number (default is 514 for standard SYSLOG)
- a device name
- optionally the IP Address of the network port used for the measurement can be activated
- configuration of the output format:
  - Meinberg Standard Format
  - Key-Value-Pairs (SPLUNK friendly)
  - JSON Format

As Network Protocol options you can choose between the UDP or TCP/IP protocols, running as per default on a port:514.

Name of this SyncMon device: you can monitor your network by different Sync Monitoring devices. You can give them unique names to recognize it easily in the database server, where the data come from.

The Meinberg Standard Format corresponds to the SyncMon data format stored in a file system on a LANTIME. This will be later used for the SyncMon Manager. The SyncMon Manager is currently in development and will be able to visualize the data stored on an external server and generate reports.

An excerpt of the SyncMon format “Meinberg Standard Format” sending via Syslog protocol:

```
SyncMon 172.27.100.32 M3000_100_57_NTP_LAN0 58154 34813 2018-02-05T09:40:13+00:00
0.000000494 0.000041453 0.000073266 1 R -0.000011100 0.000041453
```

For more Details about SyncMon formats see chapter "Appendix → SyncMon Formats".

**9.1.12.14 Copy Monitoring Data to external Server via RSYNC as a Backup**

In SyncMon Menu in the Web Interface menu "System Settings → External Rsync-Server Configuration" you can configure up to 3 external Servers, where the measured data is copied every hour or once at 00:00 UTC via the RSYNC protocol. On the external server has to run a service like a standard RSYNC-Server.

In the following dialog you can configure the target servers where you want to store your data.

![External Data Server Configuration](image)
9.12.15 SyncMon Configuration

With the "SyncMon Configuration" button some system configuration parameters can be set:

- Source Port of outgoing NTP packets: default is 33000.
- Base Path for logfiles for history of days. The default path is the internal compact flash with /data. e.g. this could be changed to /mnt/usb-storage if an USB-Memorystick is used.
- Enable Monitoring of System internal parameters.

![SyncMon Configuration](image)

*Figure: System Parameters settings within the SyncMon feature. Here you can set the current path where the data is stored. Be aware when the flash card is full, the oldest data will be overwritten.*

**Enable System Monitoring:** the monitoring of internal signals like CPU-Utilization, local NTP, ESI inputs, MRS-References and Refclock parameters, depending on integrated hardware of the system will be activated. By default the monitoring of the system is disabled.

The measured data of the monitored nodes will be stored in separate directories on a flash disc. The base path of the stored data files can be configured by the user, therefore it is also possible to use an external flash disc (e.g. USB stick). The data will be stored separately for each day and each monitored node.

```
/data
  /stats
  /syncmon
    /alias-name1
      /ntp_mon_stats.20190501
      /ntp_mon_stats.20190502

```

*Figure: Example for default path structure of history of days data files on the flash card.*
The data file format:

1. **MJD**: Modified Julian Date - is the continuous count of days since the beginning of the Julian Period (started at 1858 Nov 17 – 0:00)
2. time past midnight in seconds
3. time stamp (ISO from MJD and time past midnight)
4. measured clock offset raw (If the request interval is less than the Logging interval then the mean value of the measured offsets at request interval will be stored)
5. in case of NTP: clock offset median (Median of the 5 last measured offsets at request-int
   in case of PTP: reported offset
6. path delay in seconds
7. NTP stratum or PTP state
8. ‘R’ (optional indicator for min/max values of raw data: if the request interval is less than the log-
   interval then automatically the Min and Max values of the raw data will be stored in the next 2 lines
9. see 8. (optional)
10. see 8. (optional)
11. ‘M’ (optional indicator for min/max values of MTie (Maximum Time interval error) values from PTP
    nodes which supports this option: if the PTP node support MTie feature with extended TLVs then the
    Min and Max values will be stored in the next 2 lines.
12. see 11. (optional)
13. see 11. (optional)

Samples of Monitoring Data stored in the history of days files:

Example for NTP data files:
```
# Day Sec Modified_Julian_day_time Raw_offset Median_offs Path_delay Stratum
58043 21705 2017-10-17T06:01:45+00:00 -0.000000129 -0.000000053 0.000007667 1
```

Example for NTP data files with request interval less than log interval:
```
# Day Sec Modified_Julian_day_time Raw_offset Median_offs Path_delay St Min Max
58043 21705 2017-10-17T06:01:45+00:00 -0.00000129 -0.000000053 0.000007667 1 R -0.01 0.01
```

Example for PTP data files:
```
# Day Sec Modified_Julian_day_time Raw_offset Report_offs Path_delay Portstate
58043 21705 2017-10-17T06:01:45+00:00 -0.000000129 -0.000000053 0.000007667 9
```

Example for PTP data files supporting MTie feature:
```
# Day Sec Modified_Julian_day_time Raw_offset Median_offs Path_delay St Min Max
58043 21705 2017-10-17T06:01:45+00:00 -0.00000129 -0.000000053 0.000007667 9 M -0.01 0.01
```
9.1.12.16 System Utilization

With the latest SyncMon version it is possible to configure up to 1000 nodes to monitor. The request and logging interval can be set to 1s. Be aware that system CPU will be heavily used in case of high counts of nodes and low request and log-intervals. This could decrease the NTP server performance as well.

Examples:

- 10 monitoring nodes with log-interval = 1s will store 70MBytes (69194kBytes) per day – the default size of the flash used for SyncMon logging is about 400MB – so 5 days can be stored on internal flash disk.
- 100 monitoring nodes with log-interval = 1s will store 700MB per day – then data logging will stop if the flash is full – the log rotating for SyncMon will be started at 00:00 UTC and will erase data files older than 2 days. The CPU utilization will increase about 10%.
- 100 monitoring nodes with request interval = 1s and log-interval = 64s will store about 12MBytes per day – so about 40 days can be stored on internal flash disk. The CPU utilization will increase about 7%.
- 900 monitoring nodes with request interval = 1s and log-interval = 64s will store about 100MBytes per day – so about 4 days can be stored on internal flash disk. The CPU utilization will increase about 45% – this is critical for the NTP server performance of the device.

The size of a data file per day depends on the logging interval and has a size of about 110kB if log-interval is 64s.

9.1.12.17 Sync Monitor Status files via CLI

The current status of the monitored nodes as displayed in the Web-GUI is stored in an ASCII file /var/lo/sync-mon_node_status, updated after every full scan of the configured nodes and can be accessed over CLI.

Figure: The status information table accessed over a CLI.

Configuration via CLI

The configuration file can be edited with a text editor directly in the command line (CLI) of the system or can be replaced by an external prepared file. Further information can be found in the LANTIME CLI reference.
9.1.13 Documentation and Support

This page gives you access to some documents stored on your LANTIME, especially the manuals. The two lists include filename, language, file type, date and size of the documents/notes.

The LANTIME documents can be downloaded from here in order to read / print them on your workstation.

The Support Information chapter gives you all necessary information how to contact the technical support. Apart from that it provides a link to the firmware portal of Meinberg.
The "Docs & Support" Tab does also provide some important weblinks. It furthermore gives you information about the Meinberg Sync Academy - MSA.

The Meinberg Sync Academy offers and develops tutorials in the field of time- and frequency synchronization, such as NTP, PTP IEEE-1588 and many more. This Part of the LANTIME "Docs & Support" Tab provides basic information about the Sync Academy followed by some links to helpful informations on https://www.meinberg.academy/.

248 Date: 25th October 2019 LANTIME Firmware 7.00
9.2 Via Front Panel Display

9.2.1 LANTIME Display Types

For our LANTIME NTP server, there are four different display types – this is due to the design, housing and by the functionality of the systems. In principle the functionality and menu navigation in all four display types the same. The difference arises from the used receiver system and the available device options.

The high-resolution VF-Display, which is used in our LANTIME M600 systems, also offers a graphical representation of the measured input signals (NTP, PTP, IRIG, PPS ...). The graphic VF-Display is described in the following chapter.

The illustrations of the configuration menus is reacted with a four-line graphics, the menus of the respective systems may differ in the display of it (see Figure 1.0).

![Image of LANTIME Displays]

Figure 1.0 - LANTIME Displays

SyncFire 1000 / 1100 LC-Display, 4 x 20 characters
M200/M300 LC-Display, 2 x 40 characters
M400/M900/IMS LC-Display, 4 x 16 characters
M600 Vacuum Fluorescent Graphic Display (VFD), 256 x 64 Dots
9.2.1.1 Description of the graphical menu: VF-Display

The graphical menu is used to graphically display offset values 1 between a given input signal 2 and the oscillator of a GPS card. The program can be started with the ↑ button in the corresponding status menu. Furthermore, a list of various offsets for the input signals respectively is available in the MRS status function. To access it please press the ↓ button if you are in the main menu (where the current time is displayed).

The main menu of the Lantime (where time and date in the selected time zone are displayed).

Choose Reference Time ↓, MRS Management, MRS Status and Setup, and eventually MRS Status. Now you can choose whether the numerical offsets of all available input signals should be displayed or if a graphical display program should start. If the graphical option is selected you have to choose one of the input signals as a reference.

By pressing buttons ↑ and ↓ one can change among several reference signals and select one by pressing the OK button. In the graphic mode one can choose among four different display options how the offset of a given reference signal shall be displayed (online mode, full graph, statistics and scrolling mode).

The cursor position and consequently the option selection can be modified with the ↑ and ↓ buttons. In the upper right corner one can find the selected reference source signal, which offset is graphically displayed. With the OK or → button the selected graphical mode can be started.

Main menu of the graphical display with various options:

Each of these modes contains an information menu accessed by F1. One can find here some current status information as well as selection buttons and options of the current mode. With the ESC button one can always return to the menu on the upper level.

---

1 Offset: an offset is a time difference between two systems. In our example, the offset is time difference between a given input signal and an oscillator, which disciplines its local clock.

2 Input signals: GPS, PTP, PPS, NTP, TCR, FRQ– which of these input signals are available can be identified from the numerical status (Numerical Status)
Each graphic mode is displayed within a range of values: 

Display of the selected mode (here: SCROLLING MODE)

After one of the graphical menu options is selected, the current mode appears for one second on the display.
Under the current mode the origin file from which the graphic is generated appears in small fonts.

The first mode is the “ONLINE MODE”
This mode displays the last 255 offset values and it checks regularly for new offsets. When a new value appears
the graphic display shifts six pixels to the left to make space for the new values. Additionally, the time range
is displayed below and the offset range on the left.

Graph of the Online Mode (not zoomed)

With the ↑ (zoom in) and ↓ (zoom out) buttons the range of the y-axis can be changed any time in order to
display graph larger or smaller.

Graph of Online Mode (zoomed out)

The next mode is the “FULL GRAPHIC MODE”
After the status mode is displayed, offset values start being plotted. All values from the statistic file are dis-
played as long as no more than 255 values are available. If more values than a display length (255 points) are
available, only each xth offset value is displayed.

Thus a mean value graph is generated which looks similar to this one: An example of a generated graph
with the corresponding range of values (here: FULL GRAPHIC)

---

3 The display has an x and y axis: the y-axis displays the offset value, which is the higher between absolute minimum and maximum value
and is computed automatically at the first start of the menu. It is step-wisely ordered as follows: + 1, 2, 5, 10, 20, … (in 30 day [d]
units – one picosecond [ps]). The x-axis is a time axis. It shows from and until when particular offset values occur.

4 The xth value is the number of available values divided with the display length.
The range of values is automatically adjusted. The x-axis starts with the first chronological value available in the given file. The last value is not necessarily also the last value from the given file. If more than 255 values are available then only each xth value is displayed.

A legend can be displayed by pressing the F2 button. It contains the value range, as well as the minimum and maximum of the graphic. By pressing a F2 button for the second time the legend disappears.

The help menu appears by pressing the F1- information button in the “FULL GRAPHIC MODE”. It shows all available options in this mode. Other options are only partially available from here. To end this function one has to press ESC-, OK- or again the F2- button.

In the “FULL GRAPHIC MODE” the graph can be maximized or minimized with ↑ (zoom in) and ↓ (zoom out) buttons. If the legend is currently displayed, selecting the zoom-buttons causes that the range of y-axis gets automatically adjusted and the legend renewed. With the ESC-button one can get back to the main menu of the graphical program where the legend is not displayed. Alternatively, a display returns back to a “FULL GRAPHIC MODE” with a default value range.

The „Statistic“ - option comes next in the graphic menu. When you select it, you can decide if the minimum or the maximum value of the current statistics file shall be displayed or not.

The minimum or the maximum values are plotted in the middle of a display, as long as at least 128 values (a half of the display length) are available. A legend is shown on the display at the same time and apart of the minimum or maximum value also the corresponding UTC time is displayed 5.

Display of the minimum including the legend:

Display of the maximum including the legend:

The "SCROLLING MODE" comes as last in the graphical mode
After the status mode is displayed the whole available offsets are shown in a scrolling way. The ↑ or ↓ buttons refer in the „SCROLLING MODE“ to its scaled up or scaled down range of values of the y-axis. Each time when selecting these two buttons the „SCROLLING MODE“ starts again from the beginning. Pressing the OK or ← button causes that the graphic holds on; and pressing the OK or → again the graph continues to scroll on. When the mode is stopped (the value range will be displayed) one can change the y-axis value range with the ↑ (scaled up) and ↓ (scaled down) buttons. The offset values will only be scrolled to the end of a display.

---

5UTC: Universal Time Coordinated is the standardized world time which does not include daylight saving time change
and again with the OK or → button the scrolling will continue.

When the ← button is selected the displayed graph moves half of a display to the left if the „SCROLLING MODE“ has not been stopped beforehand. Even here the value range of the y-axis can be changed or the graph can be shifted a few more steps to the left. In order to continue the scrolling mode one has to press the OK or → button. If you select the ESC button then you come back to the main menu of the graphical program.
9.2.2 Front Display - Root Menu

The root menu is shown when the receiver has completed initialization after power-up. With the four arrow buttons and the buttons „OK“, „ESC“, „F1“ and „F2“ the navigation and setting of parameters can be managed. Main menu can be reached by holding „ESC“ for a few seconds. The main menu reflect some of the main parameters of the time server. First line shows the name of the device and the status of the reference clock. The text “NORMAL MODE” might be replaced by “NOT SYNC”. If a existing antenna connection is interrupted or not working properly, the text “ANTENNA FAULTY” is displayed instead.

With an integrated time code receiver it might be possible, that the message “NO DATA” appears on the display - in this case the correct value can be set in the time-code parameter submenu.

Current time and date of the timeserver with the name of the time zone (NTP uses UTC time zone) will be monitored in the bottom line. If the “SIMULATION MODE” option is enabled an “*” will be shown behind the time.

The multicolor LEDs will reflect the current state of the device:

„Ref. Time“
green: the reference clock produce valid time.
red: the reference clock produce no valid time (e.g. not synchronized)

„Time Service“
green: NTP has been synchronized to reference clock.
red: NTP is not synchronous to reference clock or sync to „local clock“

„Network“
green: all watched network ports has been “link up” detected
red: at least one of the watched network ports (look at „Setup Device Parameter / Check Network Linkup“) is not connected

„Alarm“
off: no error at moment
red: general error – more information will be shown on display.

If the symbol „F1“ will be shown in the upper right corner a help page can be displayed when pressing the „F1“ button. When pressing „F1“ from main menu a short description for menu navigation will be displayed:

Use → and ← to select different main menus. Use ↑and ↓to enter.

When pressing the „OK“ button from main menu the version of the LANTIME software, the NTP and the LINUX kernel version will be displayed.

```
ELX800    VX.XXx
SN: 000000000000
NTP: X.X.Xx@X.X
Krn.: X.X.XX.X
```
The following main menus will be displayed when pressing the arrow buttons:
9.2.3 Menu: Reference Time

The Reference Clock menu and all its sub menus will manage all status information and parameters of the reference clock. To enter the following sub menus press the "OK" button.
9.2.3.1 Optional Menu Switch Unit

With this menu you can check all important status information about the switch card unit. The example above shows a perfect mode of operation. Both power supplies (PSU1, PSU2) are connected - the two receivers are working in "normal operation mode" (CLK1, CLK2). If the second clock is not connected or in free running mode, the display shows "CLK2:0". If there is no power connected on PSU1, you can see the status "PSU1:0" on the display of the LANTIME.

With the sub-menu SCU Cntl you can configure the following parameters:

REMOTE: disabled/enabled
disable or enable remote control of the SCU

OUTPUTS: enabled/disabled
disable or enable outputs of the SCU

Selected Clk: Clk:1, Clk:2
The reference clock can be selected with the function keys or from a connected workstation - for this the mechanical switch in front of the SCU card must be locked in position "Auto". Otherwise (position "Manual") the selected clock can only be changed by using the switch of the SCU.
9.2.3.2 Menu Option Setup MRS

The internal reference clock of the integrated clock module with the high precision oscillator (OCXO HQ) can be disciplined by different time sources. Possible time sources are GPS receiver, external Pulse Per Second (PPS), IRIG 10MHz Frequency, IRIG Time Code, external NTP server or IEEE1588 Grandmaster (M400, M600, M900). The priorities for the internal controlling can be set up in configuration. The priority will define which reference source will be used next if the highest priority reference source will be no longer available. For each reference source a bias (fixed offset) and a precision value can be defined.

With the OK and arrow buttons you can choose the current status of the MRS. All possible reference clocks will be shown with the number of priority, the name of the reference clock and the current offset to the internal reference clock (OCXO). The current master will be signed with an “*” behind the name of the reference clock.

In the next menu the user can define in which order the references will be used to control the internal oscillator. The reference clock with the highest priority will be used always if this is available.

The "Fixed Offsets" can be set up in the next sub menu, if you know the constant offset (bias) of an external reference source. By default this value is 0 ns. The bias of the internal GPS receiver can not be set up – indirectly this can be done via the antenna cable length.

This precision value will determine the hold over time when switching to the next reference clock if the current master is not available anymore. If the precision is 0 the next reference clock will be switched at once. If the precision value is greater then 0 the time for switching to the next reference (hold over time) will be calculated by the following formula:

\[
\frac{\text{precision of next reference}}{\text{precision of current master}} \times \text{constant [s]}
\]

The parameter „constant“ depends on the quality of the internal oscillator.
Example:
The GPS receiver with an precision of 10ns is the current master. If this master is no longer available it will switch to the next reference source of the priority order – in this case the PPS input with a precision of 100us. With the formula \((100\text{ns}/10\text{ns}) \times 11.4\) we get hold over time of 114 seconds/1.9 min. The online display of the MRS status will show the remaining time and the calculated time. The hold over time will be recalculated if the status of the reference clocks will change.

<table>

</tr>
</tbody>
</table>

PZF STATE Corr.: 97 State: fine
FIELD: 94

This first menu will monitor the current state ("sync" or "not sync"). The next line will reflect the firmware version, the serial number of the internal GPS and the type of the integrated oscillator.

9.2.3.6 Menu: IRIG Receiver State

The first line of the display shows the system state with 8 options - described in the next paragraph. The second line will display the drift in [us] of the internal oscillator and the TFOM value (Time Figure Of Merit: the quality of the IRIG-signal, only used with IEEE 1344) and the current system configuration is shown on the third line. On the fourth line the AGC (Automatic Gain Control of the input signal) value in hexadecimal will be shown.
IRIG (TCR)

IRIG Receiver State: Bit 7 ... 0
Bit 7: Invalid UTC parameter
Bit 6: TCAP exceeded, jitter out of range
Bit 5: Lock on
Bit 4: Telegramm error
Bit 3: Data available
Bit 2: Invalid sysconf
Bit 1: Pulses enabled
Bit 0: Warmed up

Invalid UTC parameter: This bit is set to one if the checksum of the ‘Offset from UTC’ parameter, which must be used if no IEEE1344 extensions are available, is invalid. User must enter new ‘Offset from UTC’ data to clear this bit. Please note that the IRIG-receiver never leaves freewheeling mode if IEEE1344 is disabled and the UTC-Parameter are invalid!

TCAP exceeded, jitter out of range: If the jitter between two consecutive IRIG-telegrams exceeds +/- 100us the receiver switches into freewheeling mode and the ‘TCAP exceeded’ Bit is set. ‘TCAP exceeded’ is cleared if the measured jitter is below +/- 100us.

Lock on: ‘Lock On’ is set whenever the receiver is in synchronous mode and the internal oscillator correction value has settled.

Telegram error: This bit is set if the consistency check of two consecutive IRIG-telegrams fails. The IRIG-receiver switches into free wheling mode if ‘telegram error’ is set.

Data available: ‘data available’ is set if the receiver can read the timecode.

Invalid sysconf: If ‘invalid sysconf’ is set the checksum of the system configuration data is invalid. In this case the default mode ‘IEEE1344 disabled’ is selected. User must cycle the system or enter a new system configuration in the IRIG-parameter menu.

Pulses enabled: The pulse per second (PPS) signal which increases the NTP’s accuracy is turned when ‘lock on’ is set the first time. The ‘pulses enabled’ bit is set if the PPS signal is enabled.

IRIG system configuration Bit 2 ... 0
Bit 7 ... 4: reserved
Bit 3: ignore Day Of Year enabled
Bit 2: ignore TFOM
Bit 1: ignore SYNC
Bit 0: IEEE 1344 enabled
9.2.3.7 Menu: Setup Meinberg Receiver

**GPS / GLONASS (CLK)**

- Setup MRS
  - Info REFCLK
  - \(-\)Setup REFCLK\(<\)-
  - Set Outputs
- \(\rightarrow\)Antenna Length<
- Simulation Mode
- Init CLK

**PZF**

- Info PZF
- \((-\)Setup PZF\(<\)-
- Serial Outputs
- \(\rightarrow\)Trans.Distance<
- Init Time
- Ignore Lock

**WWVB, MSF, JJY ...**

- Status
- Version
- \((-\)Tran. Distance\(<\)-
- \(\rightarrow\)Setup:
  - Receiver Position
  - Tran. Distance
  - 1200km

**IRIG**

- Info TCR
- \((-\)Setup TCR\(<\)-
- \(\rightarrow\)UTC Offset
- IRIG Code
- Initial Time
- Ignore Lock

In the Reference Time \(-\)Setup Clock menu the receiver clock parameters can be configure. The antenna cable length of satellite based receivers must be entered here. The GPS and GLONASS reference clocks can be run in simulation mode.

Meinbergs PZF correlation receivers can be operate in simulation mode as well. In addition to that, the distance to the transmitter must be set in the setup menu.

For our long wave receivers (WWVB, MSF, JJY ...) there is only the setting for "Transmitter Distance" available - in the Submenu Reference Time \(-\)Info Refclock. The setup for our IRIG time code receivers includes the settings for the UTC offset and the corresponding time code. The time code receiver can also operate in simulation mode with IGNORE LOCK. With Initial Time and Init Clock (GPS, GLONASS), the time and date for the simulation mode is set.
9.2.3.8 SNS Mode - Satellite Navigation System Mode

If you are using a GNS receiver (GNS or GNS-UC with Up Converter), this drop-down menu allows you to select one or more satellite systems to be used simultaneously. The following combinations are available:

- Info GNS
- Setup GNS
- Setup MRS
- Set Outputs
- OK
- SNS Mode
- Antenna Length
- Simul. Mode
- OK
- Set Satellite
- Nav.System Mode
- *GPS/GALI/GLO
  - GLON/BEID
  - GALI/BEID
  - GPS/GALILEO
  - GALILEO only
  - GPS/BEIDOU
  - GPS/GLONASS
  - BEIDOU only
  - GLONASS only
  - GPS only
  - GPS/GALILEO
- OK
- Set GNS Param
- Init GNS Rec.

9.2.3.9 Initiate Cold Boot

This menu lets the user initialize all GNSS data, i.e. all saved satellite data will be cleared. The user has to acknowledge this menu again before the initialisation starts. The system starts operating in the COLD BOOT mode and seeks for a satellite to read its actual parameters.

- OK
- GNSS Cold Boo
- GNSS Warm Boo
- Set Position
- Set GNSS Time
- INITIATE
- COLD BOOT
- OF GNSS RECEIV
- Press F2!

9.2.3.10 Initiate Warm Boot

This menu lets the user force the receiver into the Warm Boot Mode. This may be necessary when the satellite data in the memory are too old or the receiver position has changed by some hundred kilometres since last operation. Synchronisation time may be reduced significantly. If there is valid satellite data in the memory the system starts in the Warm Boot mode, otherwise the system changes into Cold Boot to read new data.

- OK
- GNSS Cold Boo
- GNSS Warm Boo
- Set Position
- Set GNSS Time
- INITIATE
- WARM BOOT
- OF GNSS RECEIV
- Press F2!
9.2.3.11 Init Receiver Position

When the receiver is primarily installed at a new location far away from the last position saved in the receiver’s memory the satellites in view and their doppler will differ so much from those expected due to the wrong position that the GNSS receiver has to scan for satellites in Warm Boot mode. Making the new approximately known position available to the receiver can avoid Warm Boot and speed up installation.

<table>
<thead>
<tr>
<th>Antenna Length</th>
<th>Simulation Mode</th>
<th>GNSS Cold Boo</th>
<th>GNSS Warm Boo</th>
<th>INITIAL POSITION</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-&gt; Init GNSS</td>

<td>LON: 009°13'33&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Set GNSS Time</td>
<td></td>
<td>AL: 165 m</td>
</tr>
</tbody>
</table>

9.2.3.12 Init Receiver Time

If the receiver’s on-board real time clock keeps a wrong time the receiver is unable to compute the satellites’ correct elevation angles and Doppler. This submenu enables the user to change the receiver’s system time for initialisation. After the receiver has locked, its real time clock will be adjusted using the information from the satellites.

When the antenna is disconnected it is possible to set the system with any time. Note that the NTP will not synchronize to GNSS losing its reception or if the deviation to the system time is larger than 1024 seconds. In this case the menu Simulation Mode has to be active. After setting the clock manually the system time will be set and the NTP will be restarted.

<table>

Enable Outputs:
The submenu Output Options -> Enable Outputs lets the user configure at which time after power up the serial ports and pulse/frequency outputs are to be enabled. Outputs which are shown to be enabled ‘always’ will be enabled immediately after power-up. Outputs which are shown to be enabled ‘if Sync’ will be enabled after the receiver has decoded the incoming signals and has checked or corrected its on-board clock. The default setting for all outputs is ‘if Sync’.

Time Zone:
See Chapter ”Set Time Zone of Serial Outputs”. 
9.2.3.14 Menu: Serial Outputs

This menu lets the user configure the baud rate and the framing of the serial RS232 port to one of the following values:

- **Baudrate:** 300 to 19200
- **Dataformat:** 7E1, 7E2, 7N2, 7O1, 7O2, 8E1, 8E2, 8N1, 8N2, 8O1

COM0 provides a time string once per second, once per minute or on request. If the "on request" is activated you have to send the character '?' to get the timestring.

**Default settings COM0:**

<table>
<thead>
<tr>
<th>Speed</th>
<th>Framing</th>
<th>Mode</th>
<th>Signal Type</th>

<td>Meinberg Standard</td>
</tr>
</tbody>
</table>

This topic is used to select one of several different types of serial time strings or the capture string for each serial port.

The following time strings can be selected. All time strings are described in the appendix at the end of this documentation.

- Meinberg Standard
- SAT
- NMEA RMC (Rev. 2.2)
- Uni Erlangen
- Computime
- Sysplex 1
- Meinberg Capture
- SPA
- RACAL
- Meinberg GPS
- NMEA GGA (Rev. 2.2)
- NMEA RMC GGA (Rev. 2.2)
- NMEA ZDA (Rev. 2.2)
- ION
- 6021
- IRIG-J
9.2.3.15 Setup Output Time Zone

The time zone of the internal receiver can be set up. These parameters will affect the serial output lines and the timecode (IRIG) outputs. The internal time zone of the timeserver and the time of NTP will always be UTC. The time monitored in the main menu will be the time of the NTP.

The menu Set Timezone lets the user enter the names of the local time zone with daylight saving disabled and enabled, together with the zones time offsets from UTC. These parameters are used to convert UTC to local time, e.g. CET = UTC + 1h and CEST = UTC + 2h for central Europe. The values of daylight saving are configurable using the Time Zone setup menu.

Beginning and ending of daylight saving may either be defined by exact dates for a single year or using an algorithm which allows the receiver to re-compute the effective dates year by year. The figure show how to enter parameters for the automatic mode. If the number of the year is displayed as wildcards ****, a day-of-week must be specified. Then, starting from the configured date, daylight saving changes the first day which matches the configured day-of-week. In the figure October 25th is a Saturday, so the next Sunday is October 26th.

All changeover rules for the daylight saving like "the first/the second/the second to last/the last Sunday/ Monday etc. in the x-th month," can be described by the used format "first specified day-of-week after a defined date".

If the number of the year is not displayed as wildcards the complete date exactly determines the day daylight saving has to change, so the day-of-week does not need to be specified.

If no changeover in daylight saving is wanted, identical dates and times must be entered in both of the submenus (DAYLIGHT SAV ON/OFF). After this a restart should be done.
9.2.3.16 Menu: Setup Time Code

The IRIG Time Code is an optional output.

This menu lets the user select the Timecodes to be generated by internal reference clock. Most IRIG-Codes do not carry any time zone information, hence UTC is selected for output by default. If desired, the clocks local time can be output by selecting "TIME: Local".

The following codes can be selected:

- IRIG B002+B122
- IRIG B006+B126
- IRIG B007+B127
- AFNOR NF S87-500
- C37M8
- IEEE1344

Refer to chapter Timecode for details.
9.2.3.17 Option: Setup Progr. Pulses

Timer Mode
This mode simulates a programmable day assigned timer. Three turn-off and turn-on times are programmable for each output. If you want to program a switchtime, change the turn-on time "On" and the corresponding turn-off time "Off". A turn-on time later than the turn-off time would cause a switch program running over midnight. For example a program "On" 10:45.00, "Off" 9:30.00 would cause an active output from 10:45 to 9:30 (the next day!). If one or more of the three switching times are unused just enter the same time into the values "On" and "Off". In this case the switch time does not affect the output.

Pulse Outputs
Out1: Pulse Per S
Out2: Pulse Per S
Out3: Pulse Per S

Select Output
   
Output 2

Setup Output2
   Mode
   Holdover
   disabled

Cyclic Pulse enabled
Single Shot
Timer
Idle
All Sync
Time Sync
Position OK
DCF77 Marks
Pulse Per Hour
Pulse Per Min

As already mentioned, the outputs home position is selected by "active: high or low".

Cyclic Pulse mode - generating of periodically repeated pulses
The value of "Time" determines the time between two consecutive pulses. This cycle time must be entered as hours, minutes and seconds. The pulse train is synchronized at 0:00 o'clock local time, so the first pulse of a day always occurs at midnight. A cycle time of 2 seconds for example, would cause pulses at 0:00:00, 0:00:02, 0:00:04 etc. Basically it is possible to enter any cycle time between 0 and 24 hours, however usually a cycle times that cause a constant distance between all consecutive pulses make sense.

For example: a cycle time of 1 hour 45 minutes would cause a pulse every 6300 seconds (starting from 0 o'clock). The appearing distance between the last pulse of a day and the first pulse of the next day (0:00:00 o'clock) would be only 4500 sec. The value in entry field 'Cycle' turns red, when entering a time that causes this asymmetry.

DCF77 Marks
In "DCF77 Marks" mode the selected output simulates the telegram as transmitted by german time code transmitter DCF77. The generated time code is related to the local time zone. If you want DCF simulation to be disabled when the clock is in free running mode, you can enter the delay (given in minutes) for deactivat-
ing the DCF-Simulation with the "Timeout" value. DCF Simulation is never suspended, if the delay value is zero.

**Single Shot Modus**
Selecting Single Shot generates a single pulse of defined length once per day. You can enter the time when the pulse is generated with the "Time" value. The value "Length" determines the pulse duration. The pulse duration can vary from 10 msec to 10 sec in steps of 10 msec.

**Pulses Per Second, Per Min, Per Hour Modes**
These modes generate pulses of defined length once per second, once per minute or once per hour. "Length" determines the pulse duration (10 msec...10 sec).

**Position OK, Time Sync and All Sync**
Three different modes are selectable for output of the clocks synchronization state. The Mode ‘Position OK’ activates the output when the receiver has sufficient satellites in view to calculate its position. In "Time Sync" mode the respective output is activated when the clocks internal timebase is synchronized to the GPS timing. The “All Sync” Mode performs a logical AND operation of the both states previously mentioned, i.e. the output is activated if the position can be calculated AND the internal timebase is synchronized to the GPS timing.

**Idle Mode**
Selecting "Idle" deactivates the output.

**Holdover**
If "enabled" is selected the operation of the output remains. Otherwise (‘disabled’) the operation of the output will be switched off when synchronization is lost.
9.2.3.18 Option: Synthesizer Frequency Output

This setup menu lets the user edit the frequency and phase to be generated by the on-board synthesizer. Frequencies from 1/8 Hz up to 10 MHz can be entered using four digits and a range. The range can be selected if the „UP“ or „DOWN“ key is pressed while the cursor is positioned on the frequency’s units string. If the least significant range has been selected valid fractions of the frequency are .0, .1 (displayed as 1/8), .3 (displayed as 1/3), .5 and .6 (displayed as 2/3). Selection of 1/3 or 2/3 means real 1/3 or 2/3 Hz, not 0.33 or 0.66. If frequency is set to 0 the synthesizer is disabled.

The last line of the display lets the user enter the phase of the generated frequency from \(-360^\circ\) to \(+360^\circ\) with a resolution of 0.1°. Increasing the phase lets the signal come out later. Phase affects frequencies less than 10.00 kHz only, if a higher frequency is selected a message “(phase ignored)” informs the user that the phase value is ignored.
9.2.4 Menu: Time Service

The NTP configuration page is used to set up the additional NTP parameters needed for a more specific configuration of the NTP subsystem. The optional available PTP adjustments can be done with this menu.
9.2.4.1 Menu NTP

Additional external NTP servers can be set up to provide a high grade of redundancy for the internal reference clock.

The internal reference clock always has priority over the external NTP servers. If the internal reference clock is not synchronized or has failed, the NTP will automatically switch to an external NTP server. With this menu item some external NTP server can be configured.

9.2.4.2 Menu: external NTP

9.2.4.3 Menu: Stratum of local clock

The local clock is only chosen as the NTP time reference after the reference clock lost its synchronisation. The stratum level of the local clock is set to 12, this ensures that clients recognise the switchover to the local clock and are able to eventually take further actions. The local clock can be disabled if the timeserver should not answer anymore when the reference clock is out of order. The field “Stratum of local clock” is used to change the stratum level of the local clock, default value is 12.
9.2.4.4 Menu: Restart NTP

The system time is setup, together with the reference time and the NTP service is rebooting.

![Diagram of NTP options]

Reset time and restart NTP?
Press F2 to confirm.
9.2.4.5 Option: Menu PTPv2 - IEEE 1588-2008

The menu for PTP IEEE 1588 configuration is located in the “Time Service” main menu. A device with more than one PTPv2 cards (also called TSU - Time Stamp Units) lists all cards in the sub menu which follows. With ↓ and ↑ buttons one can select among different PTP cards available in the system. A slot number, MAC address and the current state of the selected TSU will be displayed.
9.2.4.6 Menu TSU Info

The page ‘TSU Info’ gives an overview of the state of the most important PTP parameters from the time stamp unit which is connected to the PTP0 interface. The appearance of this page is depending on the mode of the PTP engine. There are different states of a TSU possible. For example, if the unit is configured as a PTP Grandmaster clock, then this page shows the ‘Master’ state. On the other hand in MRS (Multi Reference Source) devices, the PTP mode “Slave” is displayed here.

The full list of TSU States is as follows:

- **uninitialized:** The port is booting up, the software daemon has not yet started, the IP address is not yet assigned.
- **initializing:** In this state the port initializes its data sets, hardware, and communication facilities.
- **faulty:** Not defined in LANTIME systems.
- **disabled:** PTP service has been disabled on this port, either by user configuration or because the module is in a standby mode.
- **listening:** The port is waiting for the announceReceiptTimeout to expire or to receive an Announce message from a master.
- **preMaster:** A short transitional state while the port is becoming a master.
- **master:** The port is a current master.
- **passive:** The port is in passive mode, meaning there is another master clock active in the PTP domain. The port can enter master state when it wins the BMCA (Best Master Clock Algorithm) due to a failure/service degradation of the current master.
- **uncalibrated:** One or more master ports have been detected in the same domain. The TSU is waiting to calculate the path delay to a Grandmaster.
- **slave:** The port has successfully subscribed to a master and receives all expected messages. It also successfully measured the path delay using delay request messages.

Values Offset and Delay

- **“Master” state:** 0 ns since they refer to its internal clock.
- **“Slave” state:** they show the offset to the Grandmaster and the mean network delay between the master and a slave.

**Link:** status 0: The queried port is down, check the link LED. If faulty, replace the network card. status 1: The port of interest is in normal operation.
Domain: A PTP domain is a logical group of PTP devices within a physical network that belong to the same domain number. Slave devices that shall sync to a certain master within a network must have been configured with a unique domain number which is the same as on the master.

GM: A MAC address of the current Grandmaster.

DelayMech: two options possible:
- E2E (End-to-end) where delay measurement messages are sent from the slave to the master (the two end nodes).
- P2P (Peer-to-peer): where each device (a peer) in the network exchanges peer-delay measurement messages. This way each device can keep track of the delays between itself and its immediately connected neighbors. P2P mechanism can be used in 1588 PTP-capable networks only.

NetwProto: two options possible:
- ETH-IEEE 802.3 / Ethernet (Layer 2): Ethernet frame including MAC addresses of a destination and a source.
- UDP-UDP/IPv4 (Layer 3): User Data Protocol one of the main protocols used for the Internet.
9.2.4.7 Menu TSU Setup

With this menu, all PTP parameters can be configured for the selected interface:

The **Set Dbg Level** menu is for maintenance and debugging purposes only, therefore leave it unchanged unless advised by a technician. The Level of debugging can be increased from 0 (default) to 3 with additional data being logged at each increased debugging level.

**Set temp Offs** is an offset value set temporarily, mainly for a debugging purpose. With the next warm boot the value is set back to 0.

**Enable Stats** option is also mainly for debugging. Per default it is disabled.
9.2.4.8 Menu PTP Mode

The number of different PTP operation modes depends on the feature set of the purchased unit.

Supported modes on a GPS-only or GPS/GLONASS-only system:
- PTPv2 Multicast Master
- PTPv2 Unicast Master

Supported Modes on a MRS system:
- PTPv2 Multicast Slave
- PTPv2 Multicast Master
- PTPv2 Multicast Auto
- PTPv2 Unicast Slave
- PTPv2 Unicast Master

The number of different PTP operation modes depends on the feature set of the purchased unit.
9.2.4.9 Load PTP Presets

Each PTP preset represents a set of PTP configuration parameters that will switch the PTP engine to a dedicated PTP profile. After a preset has been selected, the user still has the opportunity to change all PTP parameters and "fine-tune" them.

Note: Whenever a PTP preset is selected, all previously saved PTP parameters will be overwritten!

Six different presets are supported:

In Multicast Master / Slave Mode:

Delay Request Response Default Profile
- Sync Msg Rate: 1/sec
- Ann Msg Rate: 2 sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "E2E"

Peer-to-Peer Default Profile
- Sync Msg Rate: 1/sec
- Ann. Msg Rate: 2 sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "P2P"

Power Systems Profile
- Sync Msg Rate: 1/sec
- Ann Msg Rate: 1/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "P2P"
- VLAN (802.1Q) enabled (VLAN ID:0, Prio:4)
- Power Profile TLVs enabled

Telecom ITU-T G.8275.1
- Ann Msg. Rate: 8/sec
- Sync Msg. Rate:16/sec
- Del Req Rate: 16/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "E2E"
- Network Prot. "Layer 2 (IEEE 802.3)"
### Unicast Master / Slave Mode:

**Telecom ITU-T G.8265.1**
- Ann Msg. Rate: 1/sec
- Sync Msg. Rate: 16/sec
- Del Req Rate: 16/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "E2E"
- Network Prot. "Layer 3 (UDP/IPv4)"

### Unicast or Multicast Master / Slave Mode:

**SMPTE ST 2059-2**
- Ann Msg. Rate: 4/sec
- Sync Msg. Rate: 8/sec
- Del Req Rate: 8/sec
- Priority 1: 128
- Priority 2: 128
- Delay Mech: "E2E" or "P2P"

**Custom Profile**

By selecting "Custom" settings all parameters are ready for editing.
### 9.2.4.10 PTP Parameters

Depending on the selected mode, different sub menus will appear for configuring the PTP parameters.

#### MULTICAST MASTER

| >Priorities < | Priorities | Priorities | Priorities |

### 9.2.4.11 Multicast Master

In Multicast mode all PTP messages will be sent as Multicast packets where receiving nodes (slave clocks) do not require to know the identity of the time sources in the network. The selection of the active time source (the Grandmaster) follows the so-called “Best Master Clock Algorithm” a mechanism that all participating PTP masters must follow. The multicast communication model requires a minimized configuration of all participating nodes and this advantage is beneficial in smaller networks. In larger networks it is considered inefficient as the content of message is forwarded to all nodes, requiring them to spend network bandwidth and CPU resources.

The following settings can be done in Multicast Master Mode.

**Priority1:** The attribute is used in the execution of the best master clock algorithm (BMCA). Lower values take precedence.

Configurable range: 0..255.

The operation of the BMCA selects clocks from a set with a lower value of priority1 over clocks from a set with a greater value of priority1.

**Priority2:** The attribute is used in the execution of the BMCA. Lower values take precedence.

Configurable range: 0..255.

In the event that the operation of the BMCA fails to order the clocks based on the values of priority1, clockClass, clockAccuracy, and scaledOffsetLogVariance, the priority2 attribute allows the creation of up to 256 priorities to be evaluated before the tiebreaker. The tiebreaker is based on the clockIdentity. The values clockClass, clockAccuracy, and scaledOffsetLogVariance depend on the internal state of the grandmaster and cannot be configured.

**PTPv2 Domain:** A PTP domain is a logical group of PTP devices within a physical network that belong to the same domain number. Slave devices that shall sync to a certain master within a network must have configured a unique domain number which is the same on the master.

**Timescale:** two options possible:

- **PTP:** In normal operation, the epoch is the PTP epoch and the timescale is continuous. The unit of measure of time is the SI second. The PTP epoch is 1 January 1970 00:00:00 TAI time source.

- **ARB** as arbitrary: In normal operation, the epoch is set by an administrative procedure.
**One / Two Step:** Per default Two Step approach is enabled

Two Step approach: The PTP protocol requires the master to periodically send SYNC messages to the slave devices. The hardware time stamping approach of PTP requires that the master records the exact time when such a SYNC packet is going on the network wire and needs to communicate this time stamp to the slaves. This can be achieved by sending this time stamp in a separate packet (a so-called FOLLOW-UP message).

One Step approach: the SYNC message itself is time stamped on- the- fly just before it leaves the network port. Therefore, not FOLLOW-UP message is needed.

**Management Msg:** A protocol within PTP used to query and update the PTP data sets maintained by master clocks. These messages are also used to customize a PTP system and for initialization and fault management. Management messages are used between management nodes and clocks. Per default are enabled.

**DelayMech:** two options possible:

- E2E (End-to-end) where delay measurement messages are sent from the slave to the master (the two end nodes).

- P2P (Peer-to-peer): where each device (a peer) in the network exchanges peer-delay measurement messages. This way each device can keep track of the delays between itself and its immediately connected neighbors. P2P mechanism can be used in 1588 PTP-capable networks only.

**NetPr:** two options for the network protocol are possible:

- ETH-IEEE 802.3 / Ethernet (Layer 2): Ethernet frame including MAC addresses of a destination and a source.

**Msg. Intervals:** specify the settings for the PTP timing messages.

- **Anno. Intv** specifies the time for sending announce messages between masters to select the Grand Master. Available settings are: 16/s, 8/s, 4/s ... 2s, 4s, 8s, 16s with a default value 2 seconds.

- **Sync. Intv** specifies the time for sending sync messages from a master to a slave. Available settings are: 128/s, 64/s ... 64s, 128s, with a default value 1 second.

- **Requ. Intv** specifies an interval how often delay request messages are sent from a slave to the master. Delay request messages intervals 128/s, 64/s... 64s, 128s, with a default value 2 seconds.

- **Ann. Receiv** value specifies the time for announce receipt timeout messages which is 2-10 times the Announce interval, with a default of 3. This is the time for a BMCA to determine a Grand master.
9.2.4.12 Unicast Master

Unicast mode is applicable generally in larger networks to reduce the overall traffic or when the network is not set up to support multicast. Sometimes there is only one slave and one master of interest and they just want to be alone with each other to have a private conversation without other PTP capable devices being involved. Whatever the reason IEEE 1588 2008 includes support for unicast operation.

When one or more masters have been identified the slave can use Unicast Negotiation to get Announce and Sync messages sent from the master, and to get Delay Requests answered with Delay Responses.

The PTP message sequences between the master and a slave are repeated until the duration of a negotiated interval expires. For example a slave might ask for 4 Sync messages per second, for a period of 60 seconds. In this case after 60 seconds the master would stop sending Sync messages until another Sync message contract was negotiated.

If unicast mode is selected then an additional sub menu will appear to configure or display unicast specific parameters.

The following settings can be done in Unicast Master Mode:

**Priority1:** The attribute is used in the execution of the best master clock algorithm (BMCA). Lower values take precedence.

Configurable range: 0..255.

The operation of the BMCA selects clocks from a set with a lower value of priority1 over clocks from a set with a greater value of priority1.

**Priority2:** The attribute is used in the execution of the BMCA. Lower values take precedence.

Configurable range: 0..255.

In the event that the operation of the BMCA fails to order the clocks based on the values of priority1, clockClass, clockAccuracy, and scaledOffsetLogVariance, the priority2 attribute allows the creation of up to 256 priorities to be evaluated before the tiebreaker. The tiebreaker is based on the clockIdentity. The values clockClass, clockAccuracy, and scaledOffsetLogVariance depend on the internal state of the grandmaster and cannot be configured.

**PTPv2 Domain:** A PTP domain is a logical group of PTP devices within a physical network that belong to the same domain number. Slave devices that shall sync to a certain master within a network must have configured a unique domain number which is the same on the master.

**Timescale:**

Two options possible:

**PTP:** In normal operation, the epoch is the PTP epoch and the timescale is continuous. The unit of measure of time is the SI second. The PTP epoch is 1 January 1970 00:00:00 TAI time source.

**ARB** as arbitrary: In normal operation, the epoch is set by an administrative procedure.
One / Two Step: Two Step approach: The PTP protocol requires the master to periodically send SYNC messages to the slave devices. The hardware time stamping approach of PTP requires that the master records the exact time when such a SYNC packet is going on the network wire and needs to communicate this time stamp to the slaves. This can be achieved by sending this time stamp in a separate packet (a so-called FOLLOW-UP message).

One Step approach: the SYNC message itself is time stamped on-the-fly just before it leaves the network port. Therefore, not FOLLOW-UP message is needed.

Per default Two Step approach is enabled.

Management Msg: A protocol within PTP used to query and update the PTP data sets maintained by master clocks. These messages are also used to customize a PTP system and for initialization and fault management. Management messages are used between management nodes and clocks.

Per default are enabled.

DelayMech: in unicast mode only one option possible:
E2E (End-to-end) where delay measurement messages are sent from the slave to the master (the two end nodes).

NetPr: in unicast mode only one option for the network protocol possible:
UDP-UDP / IPv4 / IPv6 (Layer 3): User Data Protocol is one of the main protocols used for the Internet.

Msg. Intervals: specify the settings for the PTP timing messages.
Anno. Intv specifies the time for sending announce messages between masters to select the Grand Master. Available settings are: 16/s, 8/s, 4/s ... 2s, 4s, 8s, 16s with a default value 2 seconds.

Sync. Intv specifies the time for sending sync messages from a master to a slave. Available settings are: 128/s, 64/s ... 64s, 128s, with a default value 1 second.

Requ. Intv specifies an interval how often delay request messages are sent from a slave to the master. Delay request messages intervals 128/s, 64/s, ... 64s, 128s, with a default value 2 seconds.

Ann. Recei value specifies the time for announce receipt timeout messages which is 2-10 times the Announce interval, with a default of 3. This is the time for a BMCA to determine a Grand master.
9.2.4.13 Multicast Slave (MRS only)

The following settings can be done in Multicast Slave Mode:

**Asym:** or Default Asymmetry is an initial calibration value (in ns) and can be entered here if a certain asymmetry offset in the network path is known before the PTP unit starts. This occurs in SDH networks for example.

**Max.Path Delay:** If a measured path delay exceeds the value of this parameter (in ns), then the PTP unit is able to detect a change in the asymmetry offset and can take this into account for its delay measurements.

**Note:** Keep defaults settings here (0 ns for both parameters) unless some problems with the client synchronization accuracy are observed and only if the asymmetry offset can be measured beforehand.

**PTPv2 Domain:** A PTP domain is a logical group of PTP devices within a physical network that belong to the same domain number. Slave devices that shall sync to a certain master within a network must have configured a unique domain number which is the same on the master.

**DelayMech:** two options possible:
- E2E (End-to-end) where delay measurement messages are sent from the slave to the master (the two end nodes).
- P2P (Peer-to-peer): where each device (a peer) in the network exchanges peer-delay measurement messages. This way each device can keep track of the delays between itself and its immediately connected neighbors (for example a switch or a router). P2P mechanism can be used in 1588 PTP capable networks only.

**NetPr:** two options for the network protocol possible:
- ETH-IEEE 802.3 / Ethernet (Layer 2): Ethernet frame including MAC addresses of a destination and a source.
**Msg. Intervals:** specify the settings for the PTP timing messages.

- **Anno. Intv** specifies the time for sending announce messages between masters to select the Grand Master. Available settings are: 16/s, 8/s, 4/s ... 2s, 4s, 8s, 16s with a default value 2 seconds.

- **Sync. Intv** specifies the time for sending sync messages from a master to a slave. Available settings are: 128/s, 64/s ... 64s, 128s, with a default value 1 second.

- **Requ. Intv** specifies an interval how often delay request messages are sent from a slave to the master. Delay request messages intervals 128/s, 64/s, 64s, 128s, with a default value 2 seconds.

- **Ann. Recei** value specifies the time for announce receipt timeout messages which is 2-10 times the Announce interval, with a default of 3. This is the time for a BMCA to determine a Grand master.

**HQ Filter:** In heavy loaded networks when using non-PTP compliant switches, the "HQ Filter" can be activated to reduce the jitter. Detailed information about the usage and the configuration of the HQ filter can be found in the "PTPv2 Configuration Guide" in chapter [PTP Option](#). The Default setting is with HQ Filter disabled.
The following settings can be done in Unicast Slave Mode:

Asym: or Default Asymmetry is an initial calibration value (in ns) and can be entered here if a certain asymmetry offset in the network path is known before the PTP unit starts. This occurs in SDH networks for example.

Max. Path Delay: If a measured path delay exceeds the value of this parameter (in ns), then the PTP unit is able to detect a change in the asymmetry offset and can take this into account for its delay measurements.

Note: Keep defaults settings here (0 ns for both parameters) unless some problems with the client synchronization accuracy are observed and only if the asymmetry offset can be measured beforehand.

PTPv2 Domain: A PTP domain is a logical group of PTP devices within a physical network that belong to the same domain number. Slave devices that shall sync to a certain master within a network must have configured a unique domain number which is the same on the master.

NetPr: one setting possible:
UDP-UDP/IPv4 (Layer 3): User Data Protocol one of the main protocols used for the Internet.

Msg Intervals: specify the settings for the PTP timing messages.
Anno. Intv specifies the time interval of announce messages between master servers to select the Grand Master. Note: This value should be the same as for the master. Available settings are: 1, 2, 4, 8 or 16 seconds, with a default value of 2 seconds.

Sync. Intv specifies the time interval of sync messages that a slave requests from a master. Available settings are 0.5, 1, or 2 seconds, with a default value of 1 second.

Requ. Intv specifies an interval how often delay request messages are sent from a slave to the master. Delay request messages intervals of 1, 2, 4, 8, 16 or 32 seconds, with a default value of 8 seconds.

The Duration parameter is used to set a timeout for the grandmaster that sends out the sync packages until the timeout expires. A slave sends a new signaling message to refresh the request before the end of the Duration timeout. Thus it is receiving the requested sync packages continuously. The duration parameter will handle all message types and should be in the range between 10-300 s.
Master IPv4: The correct IP address of the Master’s PTP port must be entered in this field.

HQ Filter: In heavy loaded networks when using non-PTP compliant switches, the "HQ Filter" can be activated to reduce the jitter. Detailed information about the usage and the configuration of the HQ filter can be found in the "PTPv2 Configuration Guide" in chapter PTP Option. The Default setting is with HQ Filter disabled.
9.2.4.15 Menu PTP Network Settings

Configuration for the PTP network port

IP configuration for the PTPx interface. It can be selected if either a static IP address shall be used or if a dynamic IP address via DHCP should be assigned.

VLAN Config:
Configuration of Virtual LAN (IEEE 802.1Q) settings for the PTPx interface:

- VLAN ID: A 12-bit value (0..4096) specifying the VLAN to which the network port belongs.
- VLAN Priority: The priority indicates the frame priority level from 0 (lowest) to 7 (highest), which can be used to prioritize different classes of traffic (voice, video, data,...)
9.2.4.16 Optional Menu: 2nd Receiver

With the submenu 2ndreceiver you can select the Fallback mode (Redundant or SHS) and you also can adjust the time limits for the "Warning level" and the "Critical Level" here.

```
NTP Settings
->2nd Receiver<-
  PTP IEEE1588

->Fallback Mode<-
  Timelimits

Fallback Mode:
  Redundant
  SHS

Warning Level:
  *0  ms

Critical Level:
  25  ms
```
9.2.5 Menu: Network

In this submenu the network configuration parameters related to the network interfaces can be changed. The submenus can be selected with the arrow keys and the “OK” button:

As soon as an IP address is configured, additional network configuration can be done via network connection with TELNET, SSH or the WEB interface. Ask your network administrator for network specific parameters. Every change of the network parameters will restart the NTP. All network specific parameters will be saved on the flash disk (/mnt/flash/config/global_configuration) and will be reloaded after reboot. It is highly recommended not to edit this file manually but to configure the parameters via the several configuration interfaces (HTTP, CLI or SNMP). If this file is not present, an empty file will be created. See Appendix for the default settings of this file.

9.2.5.1 Menu: Setup Network Interfaces

In the network configuration parameters related to the network interfaces can be changed. The following submenus can be selected with the arrow keys and the “OK” button:

When configured an IP address once additionally network configuration can be done via network connection with TELNET, SSH or the WEB interface. Ask your network administrator for network specific parameters. Every change of the network parameters will restart the NTP. All network specific parameters will be saved on the flash disk (/mnt/flash/config/global_configuration) and will be reloaded after reboot.
There is a separate configuration submenu for every physical network interface. If there is no DHCP client mode activated a static IP address for each interface can be entered. IPv4 addresses are built of 32 bits which are grouped in four octets, each containing 8 bits. You can specify an IP address in this mask by entering four decimal numbers, separated by a point ".".

Example: 172.160.100.200

Additionally you can specify the IPv4 netmask and your default gateway address.

Please contact your network administrator, who can provide you with the settings suitable for your specific network.

If there is a DHCP (Dynamic Host Configuration Protocol) server available in your network, the LANTIME system can obtain its IPv4 settings automatically from this server. If you want to use this feature (again, you should ask your network administrator whether this is applicable in your network), you can change the DHCP Client parameter to "enabled". Using DHCP is the default factory setting.

If the DHCP client has been activated, the automatically obtained parameters are shown in the appropriate fields (IPv4 Address, Netmask, Default Gateway).
### 9.2.5.3 Menu: Setup IPv6 Parameter

The IPv6 parameter can be configured via the front panel display for the first ethernet port (ETH0) only. Additionally IPv6 configuration can be done via network connection with TELNET, SSH or the WEB interface.

You can specify up to three IPv6 addresses for your LANTIME timeserver. Additionally you can switch off the IPv6 autoconf feature. IPv6 addresses are 128 bits in length and written as a chain of 16 bit numbers in hexadecimal notation, separated with colons. A sequence of zeros can be substituted with "::" once.

If you enabled the IPv6 protocol, the LANTIME always gets a link local address in the format “fe80:: ...”, which is based upon the MAC address of the interface. If a IPv6 router advertiser is available in your network and if you enabled the IPv6 autoconf feature, your LANTIME will be set up with up to three link global addresses automatically.

### 9.2.5.4 Menu: Link Mode

With the Link Mode submenu the parameters for link speed and duplex mode of the first ethernet interface (ETH0) can be configured. There are 5 modes available: Autosensing, 10 Mbit/Half Duplex, 100 Mbit/Half-Duplex, 1000 Mbit/Half-Duplex (Gigabit Support), 100MBit/Full-Duplex, 100 Mbit/Full-Duplex and 1000 Mbit/Full-Duplex (Gigabit Support).

The interfaces are configured with “Autosensing” by default.
9.2.5.5 Menu: Global Configuration

In this sub menu you can change the global network settings like host and domain name, nameserver and syslog server. Further name- or syslog servers can be set up via HTTP interface or CLI Setup. In the nameserver and syslog server fields you have to enter an IPv4 address.

All information written to the LANTIME SYSLOG (/var/log/messages) can be forwarded to one or two remote SYSLOG servers. The SYSLOG daemon of this remote SYSLOG needs to be configured to allow remote systems to create entries. A Linux SYSLOG daemon can be told to do so by using the command “syslogd –r” when starting the daemon.

If you enter nothing in the SYSLOG server fields or specify 0.0.0.0 as the SYSLOG servers addresses, the remote SYSLOG service is not used on your LANTIME.

Please be aware of the fact that all SYSLOG entries of the timeserver are stored in ”/var/log/messages” and will be deleted when you power off or reboot the timeserver. A daily CRON job is checking for the size of the LANTIME SYSLOG and deletes it automatically if the log size is exceeding a certain limit.

By specifying one or two remote SYSLOG servers, you can preserve the SYSLOG information even when you need to reboot or switch off the LANTIME.

The submenu „Netw. LED“ will monitor the network ports, which will be checked continuously if the network port is „LINKED UP“. If one of these ports has no link up, the network LED on the front panel will change to red. An „L“ for „LED“ indicates if the port is checked. Please navigate through the list of ports with the LEFT/RIGHT buttons and change the setting with the UP/DOWN buttons.
### 9.2.5.6 Menu: Network Services

<table>
<thead>
<tr>
<th>Interfaces</th>
<th>OK</th>
<th>Use Up and Down to select Port: lan0:0 #1 of 1 &gt;172.160.100.200</th>
<th>OK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Cfg.</td>
<td></td>
<td>Network Services on lan0:0: SSH:* HTTPS:* TELN:* HTTP:*</td>
<td></td>
</tr>
</tbody>
</table>

The possible network protocols and access methods can be configured. After pressing the OK button you can enable/disable SSH, TELNET, SNMP, FTP, IPV6, HTTP, HTTPS and NETBIOS by using the UP/DOWN Keys and navigate through the list with the LEFT/RIGHT keys. After you saved your settings with the “OK” button, all these subsystems are stopped and eventually restarted (only if they are enabled, of course).
9.2.6 Menu: System

In this submenu system specific parameters can be configured.
9.2.6.1 Menu: Set Time Zone of Display

The time zone of the time that is shown on the front panel display can be set up here. The internal time zone of the timeserver and the time of NTP will always be UTC. These parameters will not affect the serial output lines and the timecode (IRIG) outputs. These parameters have to be configured in another menu – (Reference Time->Setup Outputs).

This menu lets the user enter the names of the local time zone with daylight saving disabled and enabled, together with the zones’ time offsets from UTC. These parameters are used to convert UTC to local time, e.g. MEZ = UTC + 1h and MESZ = UTC + 2h for central Europe. The range of date daylight saving comes in effect can be entered using the next two pages of the setup menu.

Beginning and ending of daylight saving may either be defined by exact dates for a single year or using an algorithm which allows the receiver to re-compute the effective dates year by year. The figures below show how to enter parameters in both cases. If the number of the year is displayed as wildcards (’*’), a day-of-week must be specified. Then, starting from the configured date, daylight saving changes the first day which matches the configured day-of-week. In the figure below October 25th, 2008 is a Saturday, so the next Sunday is October 26th, 2008.

All changeover rules for the daylight saving like “the first/the second/the second to last/the last Sunday/Monday etc. in the x-th month,” can be described by the used format “first specified day-of-week after a defined date”.

If the number of the year is not displayed as wildcards the complete date exactly determines the day daylight saving has to change (October 26th, 2008 in the figures below), so the day-of-week does not need to be specified and therefore is displayed as wildcards.

If no changeover in daylight saving is wanted, identical dates and times must be entered in both of the submenus (DAYLIGHT SAV ON/OFF).
### 9.2.6.2 Menu Options

In menu option you can make the following settings or request setting information:

**Time Zone:** The converted time (offset to UTC) for the configured time zone, which is shown in the display. This has no effect on the time strings that are outputted via the serial interfaces.

You can make this setting via the menu "Ref. Time -> Set Outputs -> Time Zone".

**Options:** In this sub menu you can reset the system to the state of delivery by using "Reset Factory". The network settings remain unchanged.

With "Restart NTP" you can restart the NTP service and with "Restart System" the LINUX operating system of the CPU.

**System Info:** With "System Info" you can request the current operating temperature of the CPU. If the LANTIME is used in an IMS System, information about the system configuration, like the allocation of single slots, can be displayed in this menu section.

**Fan Control:** If an active cooling is installed, the cooling status can be displayed via this menu item and via "Fan Control" you can set the mode of the active cooling:

- **Auto:** (temperature independent - the threshold value can be adjusted via the webinterface - menu "System -> Fan Control".
- **FAN ON:** The cooling is permanently active.
- **FAN OFF:** The cooling is permanently off.

### 9.2.6.3 Shutdown System

Before the system is switched off by a mains switch, make sure that processes are not interrupted that have to be completed before the device is switched off. For example, if the SyncMonitor is stopped abruptly when saving data to the internal flash, this data will be lost.
The "Shutdown" stops the LANTIME daemon and the SyncMonitor and prepares the system for shutdown.

9.2.6.4 Menu: Restart System

If the time of the reference clock has changed (e.g. while testing with different times) the system time has to be set with the time of the reference clock and the NTP has to be restarted.

The command **Reboot System** reboots the Linux operating system – the built-in reference clock will not be restarted.

9.2.6.5 Menu Factory Reset

When **Reset to factory defaults** is called, all system parameters will be reset to initial values. However the parameters of each network interface do not change.
9.2.6.6 Menu System Info

In the “System Info” submenu, the CPU temperature can be queried. In IMS systems a detailed overview of the system configuration can be shown.

9.2.6.7 Option: Menu IMS Slot Info

Note: This display menu is visible only in case of an IMS system. Here a detailed overview of the modules, used in the selected slots, are given.

The example above shows the configuration of a LANTIME M3000:

- **PWR:** This string means PWR 1 is occupied and active.
- **REF:** CLK 1 is occupied, CLK 2 and RSC (SCU slot) are empty.
- **IMS:** Indicates that the IMS slots MRI 1, ESI 1 and IO 1 and IO2 are occupied and active.

More Details: With the OK button you can open the submenu “Select Slot”
9.2.6.8 Option: IMS Menu Select Slots

<table>
<thead>
<tr>
<th>Slot Name</th>
<th>IMS Type</th>
<th>More Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>PWR1</td>
<td>PWR</td>
<td>Connected</td>
</tr>
<tr>
<td>CLK1</td>
<td>REF</td>
<td>GPS180 51.0C</td>
</tr>
<tr>
<td>CPU</td>
<td>CPU</td>
<td>ELX800 64.0C</td>
</tr>
<tr>
<td>MRI1</td>
<td>TSU</td>
<td>PTPv2 TSU 63.0C</td>
</tr>
</tbody>
</table>

This menu shows which module is inserted into the selected slot.

Displayed values are:
Slot Name: In this example, PWR 1, CLK1, CPU, MRI1, IO1 and IO2
IMS Type: PWR (power supply), REF (receiver), CPU (processor unit), LIU (Telecom outputs)...

On the bottom line, the current operating temperature (degrees/celsius) is displayed.
9.2.6.9 Option: Fan Control

With the optional fan control menu the current status of the operational temperature and the fans can be displayed on the systems interface. The mode of the fans can be selected here:

- **FAN ON**: the ventilators are always running
- **FAN OFF**: the ventilators are off
- **Auto**: the ventilation runs from the temperature, which is specified by the "Temperature Threshold" parameter (see "The Web Interface"). The default value is +55 degrees celsius. If the temperature of the device is less than 7 degrees (Celsius) as the specified value, the fan control turns off automatically.
9.2.7 USB Stick Menu

LANTIME NTP servers provide an USB interface for connecting an USB storage device. The USB stick can be used in combination with the LANTIME or the LAN-CPU for various tasks:

- Transfer configuration parameters between different LANTIMEs
- Keypad locking for secure using the keypad of the LCD
- Transfer of log files
- Install Software Updates
- Upload and download secure certificates (SSL, SSH) and passwords

When connecting the USB stick the LC-Display will – after a few seconds – signal that the USB stick has been detected and allows you to enter the USB menu with the "OK" button.

The desired menu function can be chosen by using ↑ and ↓ keys and it will be activated with the "OK" button. You can leave this menu with removing the USB storage or with the "ESC" button.

Menu "Install Firmware"

If a firmware update file is stored on the USB stick, the menu item "Install [Firmware Version]" appears on the display. Now you can install the update package on the LANTIME by pressing the OK button. The file format is firmware-6.24.020-x86.rel. However, only the version is shown in the display, in this example 6.24.020-x86.
Menu “Save as Startup”
If this menu item is confirmed with the OK key, the firmware configuration of the LANTIME currently marked as "Start configuration" is saved on the USB stick.

Please Note:
Even if you are currently making changes to a LANTIME, you can only save the configuration on the USB stick which you have confirmed via the web interface as "Startup configuration". This has the advantage that you can save your "old" configuration even if you make extensive changes to the settings of your system.

Menu "Backup Configuration to USB Stick"
With this submenu you can copy the configuration file from your LANTIME to the USB storage device. The stored configuration you can then find on your USB stick under /Lantime/Config/USB_Backup/xxxxxxxxxxxx (xxx.. = the 12-digit serial number of your LANTIME).

If the backup is to be imported on other LANTIMEs, the directory must be renamed:
/Lantime/Config/USB_Backup/ANY_SN

Menu “Write Diagnostic File to USB Stick”

This submenu is an easy way to get the contents of the LANTIMEs diagnostic files. After you push the OK button, the system will copy a file archive to your USB device: /Lantime/Diag/ltdiag.tgz
Keypad locking
The USB stick can be used for locking the function buttons of the LANTIME LC Display. Activating this feature the user cannot use the buttons without connecting the USB stick to the LANTIME. The access authorisation has been realized with a password file on the USB stick `/Lantime/keypad_lock`. This password file will be compared with `/mnt/flash/config/keypad_lock`. So it is possible to manage different LANTIME with one USB stick.

The keypad locking will be activated with a submenu from the USB stick:

```
USB Stick Menu
(OK to confirm)
Lock
Front Panel
```

When activating this submenu the file `/mnt/flash/config/keypad_lock` will be copied to the internal flash. When de-activating the keypad locking this file will be removed from the internal flash.

```
USB Stick Menu
(OK to confirm)
Unlock
Front Panel
```

Note:
Make sure, that you never loose the "Keypad_Lock" file or the USB storage device! If you have problems, please contact Meinberg Radio clocks: Mail to techsupport@meinberg.de .

Menu Restore Configuration
This command is for restoring the LANTIME configuration. The Timeserver restarts after this procedure.

1. A USB stick is required, on which a backup file is stored
2. The backup will only be imported, if a directory with the appropriate SN is available (or "ANY_SN")
3. After "Restore" the config is not bootable yet. To activate this, you must first execute the 'saveconfig' command via a CLI (console program) or use the web interface and press the "Save as Startup Configuration" button.
9.3 Via Serial Connection

Initial Start of Operation: LANTIME Configuration Wizard

After the boot-phase of the device, you have to establish a serial connection with the LAN-CPU. Via the terminal connection it is possible to configure parameters with a command line interface. Use a NULL-Modem cable or a CAB-CONSOLE-RJ45 cable to connect your PC or Laptop. You can use for example the standard Hyperterminal program, shipped with your Windows operating system. Configure your terminal program with 38400 Baud, 8 Databits, no parity and 1 Stopbit. The terminal emulation has to be set to VT100. After connecting the LANTIME the login message appears (press RETURN for initial connection):

After the connection is successfully established use your login credentials in the welcome screen to enter a console.

Welcome to Meinberg LANTIME
login: _

Default settings are:
Login: root
Password: timeserver
(It may be the case to press a RETURN button again).

After successful registration change the current path to /wizard/. Start now the LANTIME Basic Configuration Wizard with "startwizard".

The following Wizard Welcome screen is now displayed:

Confirm with "y" to start the configuration for all the following settings.

At the end please confirm your configuration.

After the lantime has been assigned to a correct IP address, all other settings can be done via the extensive and powerful web interface (see chapter Via Web GUI).
9.4 Via SNMP

9.4.1 The Simple Network Management Protocol

Most network connected devices support a number of management options including the Simple Network Management Protocol, or SNMP. SNMP is a network protocol which allows a single network management system to monitor a large number of devices on the network.

The way it works is each network element has an Agent which communicates with the Manager via SNMP. Each Agent has a corresponding Management Information Base, or MIB. The MIBs organize data elements in a tree structure. It is written in a standard, highly structured language so that the MIBs from all of the devices on the network can be compiled into the same Manager.

MIB elements are called Object Identifiers or OIDs. They consist of configuration variables, status variables, tree structure labels and notifications. The OIDs can be read or changed using SNMP SET and GET commands. There are also recursive commands which allow the Manager to ask for all of the OIDs in a branch (subtree), or even the whole tree. This process is referred to as "walking the MIB". Event Notifications, commonly referred to as traps, are a special type of OID. A trap can be configured so that when the status of the device changes a message is immediately sent from the Agent to the Manager.
9.4.2 MIB Objects of a LANTIME

An LTOS operating systems running on Meinberg LANTIME servers supports all SNMP versions (v1,v2c and v3) with a full functionality. The LANTIME proprietary OIDs are structured into subtrees, which define a particular system component or a mode of operation. The main subtree with OIDs referring to the LANTIME status of different modes is called LantimeNGStatus, NG standing for New Generation of LANTIME features in the V6 firmware. The LantimeNGStatus consists of eight subtrees, where Refclock, NTP, PTP, SystemHardware, Cluster and Misc are the most important to monitor.

9.4.2.1 Refclock subtree

Here is a short list of OIDs from the NGStatus subtree with corresponding descriptions:

mbgLtNgRefclockState
This OID describes a current state of a LANTIME refclock (hardware clock module) referring to GNSS or any other time source signal in MRS (Multi Reference Source) model.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:</td>
<td>refclock is not available: See the possible troubleshooting:</td>
</tr>
<tr>
<td></td>
<td>1. Refclock module cannot be accessed.</td>
</tr>
<tr>
<td></td>
<td>2. Check if it is damaged and replace it if necessary.</td>
</tr>
<tr>
<td>1:</td>
<td>synchronized: The reflock of your system is correctly synchronized to the selected time source (GPS or MRS). In an MRS system, a refclock can be synchronized to a reference time source from the priority list. See an example in the next figure.</td>
</tr>
<tr>
<td></td>
<td>The MRS system above synchronizes first to GPS, but if the GPS signal is unavailable, the refclock switches to the next time source from the priority list (PTP in our case). The switch happens only after a trust time of the unavailable time source (GPS signal) has run out. This is to prevent hopping from one time source to another in short time periods. If GPS becomes available again, the refclock switches back to GPS, without waiting for the PTP trust time in this case, since GPS itself a higher precision than PTP.</td>
</tr>
<tr>
<td>2:</td>
<td>not synchronized: Obviously the refclock is not synchronized to its time source. Here is the possible troubleshooting:</td>
</tr>
<tr>
<td></td>
<td>A) Check if the GPS antenna is connected and reference time received. More about how to mount and position Meinberg GPS antenna correctly learn here.</td>
</tr>
<tr>
<td></td>
<td>B) If GPS is the current time source, check number of satellites in view. There should be at least four to provide sync information.</td>
</tr>
<tr>
<td></td>
<td>C) Start “warm boot” to refresh current satellite position. This is useful especially if the physical position of your LANTIME has been displaced by more than 100 km from its previous location and therefore obsolete satellite data are still stored in the system.</td>
</tr>
<tr>
<td></td>
<td>D) Start “cold boot” to update a satellite almanac.</td>
</tr>
<tr>
<td></td>
<td>E) If nothing from above helps, the GPS clock module needs to be changed.</td>
</tr>
</tbody>
</table>

It is recommended configuring your network management software to check this status regularly, if possible every 60 s.
mbgLtNgRefclockLeapSecondDate
This OID conveys information about the next Leap Second Date. If the upcoming Leap Second Date has not been announced yet, the OID holds information about the previous leap second event.

Here is short summary of the leap seconds. There are two different timescales we usually talk about in the sync environment: GPS, which stands for Global Positioning System time and UTC (Universal Time Coordinated), formerly known as GMT (Greenwich Mean Time). They differ from each other by number of leap seconds introduced since beginning of GPS time on 6-Jan-1980. In the moment of writing the UTC is 16 seconds behind the GPS time, which is due to the uneven rotation of the Earth.

Since the introduction of a new leap second influences the time in the whole system being synchronized, we suggest to check this status regularly, e.g. 1/hour.

Next in a row of OIDs are those referring to NTP status. They can be found in the “mbgLtNgNtp” subtree.

9.4.2.2 NTP subtree
Here is a short list of OIDs from the NGStatus subtree with corresponding descriptions:

mbgLtNgNtpCurrentState
This is one of the most important OID in this subtree to check regularly. It informs about the NTP service of your LANTIME. There are three states possible:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:</td>
<td><strong>not available:</strong> See the possible troubleshooting:</td>
</tr>
<tr>
<td>A)</td>
<td>Check if NTP service is actually enabled at a given LAN interface.</td>
</tr>
<tr>
<td></td>
<td>To check it, log in to a webinterface. Factory default credentials:</td>
</tr>
<tr>
<td></td>
<td>root/timeserver. Go to menus: “Network → Network Services” and activate the service of the corresponding interface. See Figure 3 for details.</td>
</tr>
<tr>
<td></td>
<td>B) Check if it is damaged and replace it if necessary.</td>
</tr>
<tr>
<td>1:</td>
<td><strong>not synchronized:</strong> In case of ‘not synchronized’ the NTP service is not yet synchronized to a reference clock. Possible causes for this state are as follows:</td>
</tr>
<tr>
<td>A)</td>
<td>NTP daemon is still in its initialization phase for which it needs approx. 3-5 min. Therefore wait a while and see if the status changes.</td>
</tr>
<tr>
<td>B)</td>
<td>If a refclock is not sync, the same is indicated in the NTP status. In such case NTP daemon is switched to synchronize to its local clock and its stratum value changes to 12. Please check the possible troubleshooting for a refclock status as described above.</td>
</tr>
<tr>
<td>2:</td>
<td><strong>synchronized:</strong> The NTP service is in normal operation. The LANTIME is now working properly.</td>
</tr>
</tbody>
</table>

It is recommended to check NTP status regularly, but not more than every 64 s.
9.4.2.3 Hardware subtree

mbgLtNgSysPsStatus
If a LANTIME has a redundant power supply (RPS) unit, it is important to check the status of both RPS modules regularly. This PowerSupplyStatus OID can be found in the System Hardware subtree. The following states are available:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:</td>
<td><em>notAvailable</em>: The queried power supply unit is not recognized by a system. Check to see if it is damaged, and replace it if necessary.</td>
</tr>
<tr>
<td>1:</td>
<td><em>down</em>: The power supply unit of interest is not in service. Check to see if it is damaged, and replace it if necessary.</td>
</tr>
<tr>
<td>2:</td>
<td><em>up</em>: The queried power supply module is in operation.</td>
</tr>
</tbody>
</table>

It is recommended to check this OID every 60 s.

9.4.2.4 Misc subtree

mbgLtNgEthPortLinkState
In the mbgLtNgMisc subtree one can find an EthPortLinkState OID which identifies the status of each physical Ethernet port of a LANTIME. Available values:

| Status | Description | |
|--------|-------------|
| 0:     | *notAvailable*: The queried port is down, check the link LED. If faulty, replace the network card. |
| 1:     | *up*: The port of interest is in normal operation. |

It is recommended to check this OID every 60 s.
9.4.2.5 PTP subtree

If your LANTIME has IEEE 1588 PTPv2 functionality, the corresponding PTP OIDs can be found in the "mbgLt-NgPtp" subtree. These are the most important OIDs to monitor:

mbgLtNgPtpPortState

The following PTP Port States are possible:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:</td>
<td>uninitialized: The port is booting up, the software daemon has not yet started, the IP address is not yet assigned.</td>
</tr>
<tr>
<td>1:</td>
<td>initializing: In this state the port initializes its data sets, hardware, and communication facilities.</td>
</tr>
<tr>
<td>2:</td>
<td>faulty: Not defined in a LANTIME.</td>
</tr>
<tr>
<td>3:</td>
<td>disabled: PTP service has been disabled on this port, either by user configuration or because the module is in a standby mode.</td>
</tr>
<tr>
<td>4:</td>
<td>listening: The port is waiting for the announceReceiptTimeout to expire or to receive an Announce message from a master.</td>
</tr>
<tr>
<td>5:</td>
<td>preMaster: A short transitional state while the port is becoming a master.</td>
</tr>
<tr>
<td>6:</td>
<td>master: The port is a current master.</td>
</tr>
<tr>
<td>7:</td>
<td>passive: The port is in passive mode, meaning there is another master clock active in the PTP domain. The port can enter master state when it wins the BMCA due to a failure/service degradation of the current master.</td>
</tr>
<tr>
<td>8:</td>
<td>uncalibrated: One or more master ports have been detected in the domain.</td>
</tr>
<tr>
<td>9:</td>
<td>slave: The port has successfully subscribed to a master and receives all expected messages. It also successfully measured the path delay using delay request messages.</td>
</tr>
</tbody>
</table>

It is recommended to monitor the PtpPortState OID every 3 s
### 9.4.3 SNMP Traps

OID: .1.3.6.1.4.1.5597.30.3.0.99
Severity: Info
Short explanation: trap to be sent when a test notification has been requested
Reference to other chapters: no further information
Cleared By: -
10 Troubleshooting and Alarming

10.1 NTP Messages

Error and System message / Explanation

NTP Not Sync
The NTP service of a LANTIME is not sync.

Troubleshooting / Additional information

• For LANTIMEs with built-in reference clock, please check the status of the clock on the main page. If the reference clock is not synchronized, please refer to the troubleshooting information for "CLK Not Sync".
• For LANTIMEs, which are to be synchronized by external NTP servers, make sure that the external NTP servers are reachable.
• For MRS devices, check whether MRS reference time sources are configured in the Web interface (→ Clock → MRS settings) and corresponding signals are available (→ Clock → MRS status).
• Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.

NTP Stopped
The NTP service stopped

• Info: After every configuration change relevant to the NTP, the NTP service is stopped and restarted. In this case, a message 'NTP Stopped' is written into the system log of the LANTIME.
• Contact the Meinberg TechSupport and provide a LANTIME diagnostic file, if 'NTP Stopped' is permanently displayed as NTP status in the front panel or in the web interface.

NTP Offset Limit Exceeded
LANTIME generates this message if the internal time offset between LANTIME system time and the reference clock is higher than the configured threshold value.

• Check the configured threshold value in the Web Interface: "NTP → Special Settings → Max. Internal Offset (ms.)"
• Note: After restarting the LANTIME it takes several minutes, depending on the reference time source, until the internal offset is < ±1 ms.
• Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.
10.2 Ref. Clock Messages

**Error and System message / Explanation**

**CLK Not Responding /**
The LANTIME can no longer communicate with its internal reference clock.

**Troubleshooting / Additional information**

- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file.

**CLK Not Sync /**
Performance and system resources issue of the NTP

**LANTIME with GNSS reference clock (GPS/GLN/GNS):**

- Check the antenna position:
- If the GPS reference clock is connected to a GPS antenna distributor GPSAV4 ([https://www.meinbergglobal.com/english/products/gps-antenna-distributor.htm](https://www.meinbergglobal.com/english/products/gps-antenna-distributor.htm)), make sure that the "Clock 1" port of the GPSAV4 is attached, since the GPSAV4 and the antenna are supplied by power via this port.

**LANTIME with a longwave receiver (DCF77-PZF/WWVB/MSF/JJY):**

- Check the antenna position

**LANTIME with TCR reference clock (IRIG):**

- Check whether the timecode input port at the back of the LANTIME is correctly connected to an IRIG source. In the Web interface, check whether the correct IRIG input code has been configured (Clock → IRIG Settings → Input Timecode). The input timecode is the IRIG code provided to the LANTIME by the IRIG source.
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.
Antenna Faulty

GNSS reference clock (GPS/GLN/GNS):
The antenna has not been detected.

- Check the connections between the antenna and a LANTIME.
- Check the output voltage at the LANTIME antenna connector.
- To do this, disconnect the antenna cable from the LANTIME antenna port. The following voltage value should be measured between the inner and outer conductor:
  - GPS Receiver → 15-18 V DC
  - GLN Receiver → 5 V DC
  - GNS Receiver → 5 V DC
- If the voltage is 0 V DC, please contact the Meinberg TechSupport:
- If the measured voltage at the antenna port of the LANTIME is correct, reconnect the antenna cable and check the voltage at the other end of the antenna cable.
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.

Longwave receiver (DCF77-PZF/WWVB/MSF/JJY):
Either the antenna or any other input signal has not been detected.

- Check the connections between the antenna and a LANTIME.
- Check the status of the received antenna signal in the main page of the web interface. The displayed field strength value should be > 40. If this is not the case, please check how the antenna is positioned.
- Check the output voltage at the LANTIME antenna connector.
- To do this, disconnect the antenna cable from the LANTIME antenna port. The following voltage value should be measured between the inner and outer conductor: Long Wave Receiver → 5 V DC
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.
Antenna Short Circuit / Short circuit at the antenna connection.

- Disconnect the antenna cable from the LANTIME antenna connector.
- Perform a powercycle of the device
- If the LANTIME does not show the error message after the start-up, connect the antenna again. Otherwise contact the Meinberg TechSupport and provide a LANTIME diagnostic file.

GPS Warm Boot /
In warm boot mode, the GPS reference clock performs the position determination. To complete this process successfully, at least 4 satellites should be received. After successful position determination, the position will be stored in the battery-buffered memory of the clock. Thus the position determination does not to be carried out again after a restart.

- If the LANTIME can not complete the GPS warm boot process, check the number of "good satellites" that can be viewed in the web interface: "Clock → GPS (GNSS Clock → Receiver Information → Number of good satellites".
- If the number of good satellites is permanently below 4 and the LANTIME can not complete the position determination, then refer to the troubleshooting case for "CLK Not Sync".
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.

GPS Cold Boot /
In GPS Cold Boot mode, the GPS reference clock tries to download the GPS almanac, which contains the satellite track data for all satellites. To complete this process, at least 1 satellite should be received. The process takes at least 12 minutes. After the cold boot is completed, the clock automatically switches to the GPS warm boot to determine the position.

The GPS almanac is stored in the battery-buffered memory of the clock.

- If the LANTIME can not complete the GPS Cold Boot operation after more than 30 minutes, check the number of "good satellites" in the web interface: "Clock → GPS (GNSS Clock → Receiver Information → Number of good satellites".
- If the number of good satellites is 0, then refer to the troubleshooting case for "CLK Not Sync".
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.
SHS Time Limit Warning /
LANTIME systems with two built-in reference clocks send out this message as soon as the time difference between both clocks exceeded the pre-configured "Time Limit Warning Level" setting.

- Check the current time difference between the two reference clocks in the main menu of the web interface.
- Check your SHS configuration under "Security → SHS Configuration". Are the configured thresholds possibly too strict?
- Check the status of both reference clocks in the main menu of the web interface. If one of the two clocks is not synchronized, please refer to the troubleshooting case for "CLK Not Sync".
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.

Oscillator not Adjusted /
The internal oscillator is not (yet) fully disciplined. As soon as this process is finished, the LANTIME sends out a log message "Oscillator Adjusted". The time needed for an oscillator to be disciplined depends on the quality of the incoming signal, the aging and environmental influences on the oscillator.

- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.

Leap Second Announced /
LANTIMEs with a GNSS reference clock (GPS / GLN / GNS) or long wave receiver (DCF77-PZF / WWVB / MSF / JJY) send out the "Leap Second Announced" notification message as soon as they have received the announcement by the reference signal. The GPS satellites announce the upcoming leapsecond usually about half a year in advance. Long wave transmitters usually send the announcement 1 hour in advance.

- This is only an info notification, therefore no further action is required.

XMR Limit Exceed /
LANTIME generates this message when the measured time offset of an MRS time source has exceeded the configured threshold value.

- Check the current MRS time source status in the Web Interface under "Clock → GNSS Clock → MRS Status".
- Check the MRS configuration in the Web Interface under "Clock → GNSS Clock → MRS Settings". Are the configured threshold values (check the "Limit" column) configured possibly too strict?
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.
**XMR Reference Disconnected**
LANTIME generates this message if the configured MRS time source is no longer available.

- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.

### 10.3 Network Messages

**Error and System message / Explanation**

**Network Link Down**
There was no link detected at one of the LANTIME's network interface.

**Troubleshooting / Additional information**

- Check which ports are physically connected and the link should be available.
- Check for compatible network settings on switch and LANTIME.
- Check the settings for link monitoring via the Web Interface: "Network → Physical Network Configuration → Indicate Link on Front Panel LED".
  - The LANTIME monitors a link status for the ports where the "Indicate Link on Front Panel LED" option is activated.
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.
10.4 Miscellaneous Messages

Error and System message / Explanation

Fan Failure / The LANTIME has detected a fault on a fan module, or a fan module has been removed during system operation.

Troubleshooting / Additional information
- If the fan module has not been intentionally removed, contact the Meinberg TechSupport and provide a LANTIME diagnostic file.

IMS Error / Either the LANTIME has detected an error on an IMS module or an IMS module has been plugged out of the LANTIME IMS system during the operation.

Troubleshooting / Additional information
- If the IMS module has not been intentionally removed, contact the Meinberg TechSupport and provide a LANTIME diagnostic file.

CPU No Response / The display does not receive any information from the installed LANTIME CPU unit.

Troubleshooting / Additional information
- Check whether the LANTIME is still available over the network (try to ping, SSH, HTTP / HTTPS)
- Does a power cycle solve this problem?
- If the LANTIME is still accessible via HTTP / HTTPS, please download a diagnostic file via the web interface and send it to the Meinberg TechSupport. If no connection to the LANTIME is possible, contact the Meinberg TechSupport with the serial number of your LANTIME.

Certificate Expired / LANTIME generates this warning 60 days, 30 days, and 15 days before the end period of the installed SSL certificate for HTTPS service.

Troubleshooting / Additional information
- Check the validity of the installed SSL certificate via the Web Interface: "Security → HTTPS Certificate → Show SSL Certificate".
- Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance at solving the problem.
Low System Resource
LANTIME generates this warning:
directory "/var" < 1MB free
directory "/var" > 90% usage
RAM Mem free < 6MB

Troubleshooting / Additional information

• Contact your Meinberg TechSupport and provide a LANTIME diagnostic file, if you need further assistance for solving the problem.
11 Support information

In this chapter you will learn about different levels of support at the Meinberg Company. In general, the Basic Customer Support level is included in the price you pay for your Meinberg product and demands no additional costs. It includes free e-mail, phone support and free lifetime firmware updates for the lifetime of your product, i.e. for as long as you choose to use it.

Depending on the product this level also includes a 2 or 3 year hardware warranty. You can extend the hardware warranty period after the standard warranty of your Meinberg product ends.

The chapter includes:

- Basic Customer Support
- Support Ticket System
- How to download a Diagnostic File
- Self-Help Online Tools
- NTP and IEEE 1588-PTP online tutorials
- The Meinberg Academy introduction and offerings
- Meinberg Newsletter
11.1 Basic Customer Support

Contact Meinberg via e-mail or phone.

MEINBERG Remote Support

In order to assist you with configuration, installation, monitoring and diagnostics of your Meinberg products, you can download a remote support software that allows Meinberg technical support to remote control your computer.

By following this link:

https://www.meinbergglobal.com/english/support/remote.htm

you can find all necessary information and to download the support.

LANTIME Firmware Updates

To check if an update is available for your LANTIME, please visit;

and fill out the form. Available firmware updates will be provided by e-mail (LANTIME firmware V5 or older versions) or with a direct download link (LANTIME firmware V6 or newer).

11.2 Support Ticket System

Meinberg assists you quickly and directly on questions regarding the initial setup of your devices, troubleshooting or if you want to update the hard- or software. We offer free support for the whole lifetime of your Meinberg product.

- Send a mail to techsupport@meinberg.de with a description of your issue.
- A support ticket will automatically be opened.
- Our support engineers will contact you as soon as possible.
- It is always helpful for our engineers to receive a diagnostic file when you send a ticket.
- The diagnostic file includes all status data of a LANTIME system logged since the last reboot and can be downloaded from all LANTIME timeservers. The file format of the diagnostic file is a tgz-archive. → See chapter How to download a Diagnostic File how to generate this file at your LANTIME system.
11.3 How to download a Diagnostic File

In most support cases the first action is to ask the customer to download the diagnostic file, because it is very helpful at identifying the current state of the LANTIME and finding possible errors. Therefore we recommend that you attach your Diagnostic File when sending a ticket to our support.

The diagnostic file includes all status data of a LANTIME system logged since the last reboot. It can be downloaded from all LANTIME timeservers or you can save the file on a USB stick connected to the device. The file format of the diagnostic file is a tgz-archive. The archive contains all the important configuration and logfiles.

11.3.1 Download via Web GUI

- Connect to the Web GUI by putting the IP address into the address field of the web browser.
- Open the „System“ page and the submenu „Diagnostics“. 
- Press the „Download Diagnostic File“ button.

The file will take some time to be created as its size is several MBs. After the file has been created it will be automatically sent to your web browser. Then save the file to your local hard disk.

- The diagnostic file is named “lt_diag_SERIALNUMBER.tgz” and the file format is a tgz archive. You can open the tgz archive e.g. with 7Zip (https://www.7-zip.org/).

11.3.2 Download via USB Stick

- The USB stick have to be formatted in a linux compatible file system like FAT. Connect a USB stick to the USB port of the LANTIME:
- The USB Memory Stick Menu opens automatically. Press „OK“ to confirm.
- You can use the up and down arrows to move through the menu.
- Use the „Write diagnostic File to USB stick“ option to write the current diagnostic file to the USB stick.
- You can find the Diagnostic File by opening the LANTIME folder and continue on to the Diag folder.
11.4 Self-Help Online Tools

Here is the list of some informative websites where you can query different information about the Meinberg Systems.

1. Meinberg Homepage – general:
   https://www.meinbergglobal.com/

2. NTP Download – at Meinberg:
   https://www.meinbergglobal.com/english/sw/

3. NTP Client Download for Windows (NTP-time-server-monitor):
   https://www.meinbergglobal.com/english/sw/ntp-server-monitor.htm

4. LANTIME firmware update request online form:

5. Download page for Meinberg software, drivers and software:
   https://www.meinbergglobal.com/english/sw/

6. All Meinberg manuals (ENG, German versions):
   https://www.meinbergglobal.com/english/docs/

7. Meinberg Newsletter and subscription page:

8. NTP / IEEE 1588-PTP online tutorials from Meinberg:
   http://blog.meinbergglobal.com/

9. FAQs about Meinberg Products:
   https://www.meinbergglobal.com/english/faq/

10. Meinberg Knowledgebase:
    https://kb.meinbergglobal.com

11. GPS / GNSS Antenna Installation and mounting:

12. NTP support page and documentation:
    http://support.ntp.org/bin/view/Support/WebHome

11.5 NTP and IEEE 1588-PTP online tutorials

A team of Meinberg engineers are writing online tutorials covering topics on IEEE 1588 PTP, NTP, synchronization setups and configurations used in different industries.

The tutorials can be found at:
http://blog.meinbergglobal.com/

The blog provides you also the opportunity to write a comment or a question to our experts and get their reply.

Categories:
11.6 The Meinberg Academy introduction and offerings

Meinberg Sync Academy (MSA) is an institution within the Meinberg Company which takes care for education and expert knowledge dissemination in the field of time and frequency synchronization. The academy offers tutorials and courses on the latest synchronization technologies such as NTP, IEEE 1588-PTP, synchronization networks for different industries: telecom, power, broadcasting, professional audio/video, finance, IT and . The MSA courses include both, theoretical lectures and practical hands-on labs.

If you are planning or re-designing synchronization for your networks and you need additional knowledge, see our agenda for the upcoming courses.

Homepage: https://www.meinberg.academy/
Courses: Meinberg Product Training, NTP Complete, PTP Complete Customized Trainings and Online Trainings.
Course Calendar: http://www.meinberg.academy/events/
Contact Phone: +49 (0) 5281 93093-0
E-Mail: info@meinberg.de

11.7 Meinberg Newsletter

Meinberg publishes regularly up-to-date information, technical news, firmware updates and security advisory by the Meinberg Newsletter in both the English and German language.

Subscribe to the newsletter here:
https://www.meinbergglobal.com/english/contact/newslett.htm
12 Appendix

12.1 LANTIME CPU - Central Processing Unit

Booting the Single Board Computer
The LINUX operating system is loaded from a packed file on the flash disk of the single board computer to a RAM disk. All files of the flash disk are stored in the RAM disk after booting. Because of that it is guaranteed that the file system is in a defined condition after restart. This boot process takes approx. two minutes. During this time the following message appears on the display:

```
MEINBERG LANTIME is booting ...
please wait ...
........
```

After starting up the LINUX system the network function is initiated and the program for communication with the reference clock and the NTPD (NTP daemon) is started. After that NTPD starts synchronization with the reference clockss (usual the hardware clock of the single board computer and the used receiver). Until synchronization is finished the following message is displayed:

```
CLK: Not Sync
NTP: Sync to OSC
Wed, dd.mm.yyyy
UTC 12:00:00
```

For the synchronization of the NTPD, e.g. with a GPS creceiver, it is necessary that the GPS receiver is synchronous with the GPS time. In this case the following message is shown on the display:

```
NORMAL OPERATION
NTP: Offs. 2ms
Wed, dd.mm.yyyy
UTC 12:00:00
```

The second line shows the user that the NTPD is synchronized with the GPS with an offset of -50us. Because of the internal time of the NTP which is adjusted by a software PLL (phase locked loop) it takes a certain time to optimise this offset. The NTPD tries to keep the offset below ±128 ms; if the offset becomes too large the system time is set with the GPS time. Typically values for the offset are ±5 ms after the NTPD has already synchronized.
### 12.1.1 Technical Specifications LAN CPU

CPU Module Type C05F1:

12.1.2 Technical Specifications - IMS CPU-C15G2

As the central management and control element, the CPU module in an LANTIME system is responsible for management, configuration and alarm notifications. It additionally provides NTP and SNTP services on its network interface. The CPU-C15G2 is equipped with two integrated network interfaces, additional network ports can be added by installing LNE modules.

**Processor:** Intel® Atom™ Processor E Series
(2 Cores, 1.33GHz, TDP 3W)

**Main Memory:** onboard 2 GB

**Cache Memory:** 1MB 2nd Level Cache

**Flash Disk:** 4 GB

**Network Connector:**
1 x 10/100/1000 Base-T with RJ45-Jack
1 x 1000Base-T with SFP-Jack

**Serial Interface:**
RJ45 connector
cable: 38400 / 8N1,
connection via CAB-CONSOLE cable

**USB Port:**
install firmware upgrades
backup and restore configuration files
copy security keys
lock / unlock front keys

**Operating System:** GNU/Linux 4.x

**State LEDs:**
**LAN 0 Interface**
LED - Connect, Activity and Speed of the network connection

**LAN-CPU**
R - Reference Time
T - Time Service
N - Network
A - Alarm
**Supported Protocols:**

**Network Time Protocol (NTP):**
- NTP v2 (RFC 1119), NTP v3 (RFC 1305), NTP v4 (RFC 5905)
- SNTP v3 (RFC 1769), SNTP v4 (RFC 4330)

**OSI Layer 2 (Data Link Layer):** PRP (IEC 62439-3)

**OSI Layer 3 (Network Layer):** IPv4, IPv6

**OSI Layer 4 (Transport Layer):**
- TCP, UDP, TIME (RFC 868), DAYTIME (RFC 867), SYSLOG

**OSI Layer 7 (Application Layer):**
- HTTP / HTTPS (RFC 2616), DHCP,
- FTP, NTPv3 / NTPv4, SNTP,
- RADIUS, TACACS, FTP,
- SSH (incl. SFTP, SCP) - SSH v1.3 / SSH v1.5 / SSH v2 (OpenSSH),
- SNMPv1 (RFC 1157) / SNMPv2c (RFC 1901-1908) / SNMP v3 (RFC 3411-3418),
- Telnet (RFC 854-RFC 861)

**Environmental:**

**Ambient Temperature:**
- 0 ... 50°C / 32 ... 122°F

**Humidity:**
- Max. 85%
12 Appendix

12.1.2.1 Main Menu

The LANTIME webinterface provides you with configuration options and status information of your LANTIME system accessed via Web GUI. The main page contains an overview of the most important configuration and status parameters for the system.

- Information about LANTIME model and software
- Network information
- Receiver status
- NTP status
- PTP status (option)
- Last messages
- Statistics (NTP/MRS Performance, NTP Access ...)
- Extended Statistics (MRS – external reference input signals)
- Documentation (Manuals), support information

The field in the lower section shows the last messages of the system with a timestamp added. The newest messages are on top of the list. This is the content of the file /var/log/lantime_messages, which is created after every start of the system (and is lost after a power off or reboot).

By using the navigation on top of the page you can reach a number of configuration menus. All further information about management and monitoring with the LANTIME CPU can be found in our LANTIME firmware manual.
12.2 Time Telegrams

12.2.1 Format of the Meinberg Standard Time String

The Meinberg Standard Time String is a sequence of 32 ASCII characters starting with the STX (start-of-text) character and ending with the ETX (end-of-text) character. The format is:

```
<STX>D:dd.mm.yy;T:w;U:hh.mm.ss;uvxy<ETX>
```

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- `<STX>` Start-Of-Text, ASCII Code 02h
- Sending with one bit accuracy at change of second
- `dd.mm.yy` the current date:
  - `dd` day of month (01..31)
  - `mm` month (01..12)
  - `yy` year of the century (00..99)
- `w` the day of the week (1..7, 1 = Monday)
- `hh.mm.ss` the current time:
  - `hh` hours (00..23)
  - `mm` minutes (00..59)
  - `ss` seconds (00..59, or 60 while leap second)
- `uv` clock status characters (depending on clock type):
  - `u`: ‘#’ GPS: clock is running free (without exact synchr.)
  - ‘ ’ PZF: time frame not synchronized
  - ‘ ’ DCF77: clock has not synchronized after reset
  - ‘ ’ (space, 20h)
  - GPS: clock is synchronous (base accuracy is reached)
  - ‘ ’ PZF: time frame is synchronized
  - ‘ ’ DCF77: clock has synchronized after reset
- `v`: ‘*’ GPS: receiver has not checked its position
  - ‘ ’ PZF/DCF77: clock currently runs on XTAL
  - ‘ ’ (space, 20h)
  - GPS: receiver has determined its position
  - ‘ ’ PZF/DCF77: clock is synchronized with transmitter
- `x` time zone indicator:
  - ‘U’ UTC Universal Time Coordinated, formerly GMT
  - ‘CET’ European Standard Time, daylight saving disabled
  - ‘S’ (CEST) European Summertime, daylight saving enabled
- `y` announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:
  - ‘!’ announcement of start or end of daylight saving time
  - ‘A’ announcement of leap second insertion
  - ‘ ’ (space, 20h) nothing announced

```
<ETX> End-Of-Text, ASCII Code 03h
```
12.2.2 Format of the Meinberg GPS Time String

The Meinberg Standard Time String is a sequence of 36 ASCII characters starting with the STX (start-of-text) character and ending with the ETX (end-of-text) character. Contrary to the Meinberg Standard Telegram the Meinberg GPS Timestring carries no local timezone or UTC but the direct GPS time without conversion into UTC. The format is:

<STX>D:tt.mm.jj;T:w;hh.mm.ss;uvGy;lll<ETX>

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

<STX> Start-Of-Text (ASCII code 02h)

**tt.mm.jj**
- the current date:
  - **tt** day of month (01..31)
  - **mm** month (01..12)
  - **jj** year of the century (00..99)

**w**
- the day of the week (1..7, 1 = monday)

**hh.mm.ss**
- the current time:
  - **hh** hours (00..23)
  - **mm** minutes (00..59)
  - **ss** seconds (00..59, or 60 while leap second)

**uv**
- clock status characters:
  - **u**: '#' clock is running free (without exact synchr.)
  - **v**: '*' receiver has not checked its position
  - (space, 20h)

**G**
- time zone indicator 'GPS-Time'

**y**
- announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:
  - **A**: announcement of leap second insertion
  - (space, 20h) nothing announced

**lll**
- number of leap seconds between UTC and GPS-Time
  - (UTC = GPS-Time + number of leap seconds)

<ETX> End-Of-Text, (ASCII Code 03h)
12.2.3 Format of the Meinberg Capture String

The Meinberg Capture String is a sequence of 31 ASCII characters terminated by a CR/LF (Carriage Return/Line Feed) combination. The format is:

CH<sub>x</sub>_tt.mm.jj_hh:mm:ss.fffffff <CR><LF>

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **x**: 0 or 1 corresponding on the number of the capture input
- **_**: ASCII space 20h

**dd.mm.yy** the capture date:

- **dd**: day of month (01..31)
- **mm**: month (01..12)
- **yy**: year of the century (00..99)

**hh:mm:ss.fffffff** the capture time:

- **hh**: hours (00..23)
- **mm**: minutes (00..59)
- **ss**: seconds (00..59, or 60 while leap second)
- **fffffff**: fractions of second, 7 digits

<CR> Carriage Return, ASCII Code 0Dh

<LF> Line Feed, ASCII Code 0Ah
12.2.4 Format of the SAT Time String

The SAT Time String is a sequence of 29 ASCII characters starting with the STX (start-of-text) character and ending with the ETX (end-of-text) character. The format is:

\[ <\text{STX}>dd.mm.yy/w/hh:mm:ssxxxxu<vv>u<\text{ETX}> \]

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- `<STX>`: Start-Of-Text, ASCII Code 02h
  sending with one bit accuracy at change of second

- `dd.mm.yy`: the current date:
  - `dd`: day of month (01..31)
  - `mm`: month (01..12)
  - `yy`: year of the century (00..99)
  - `w`: the day of the week (1..7, 1 = Monday)

- `hh:mm:ss`: the current time:
  - `hh`: hours (00..23)
  - `mm`: minutes (00..59)
  - `ss`: seconds (00..59, or 60 while leap second)

- `xxxx`: time zone indicator:
  - ‘UTC’: Universal Time Coordinated, formerly GMT
  - ‘CET’: European Standard Time, daylight saving disabled
  - ‘CEST’: European Summertime, daylight saving enabled

- `v`: announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:
  - ‘!’: announcement of start or end of daylight saving time
  - ‘ ‘: (space, 20h) nothing announced

- `<CR>`: Carriage Return, ASCII Code 0Dh
- `<LF>`: Line Feed, ASCII Code 0Ah
- `<ETX>`: End-Of-Text, ASCII Code 03h
12.2.5 Format of the Uni Erlangen String (NTP)

The time string Uni Erlangen (NTP) of a GPS clock is a sequence of 66 ASCII characters starting with the STX (start-of-text) character and ending with the ETX (end-of-text) character. The format is:

<STX>tt.mm.jj; w; hh:mm:ss; voo:oo; acdfg i;bbb.bbbbn lll.lllle hhhhm<ETX>

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

<STX> Start-Of-Text, ASCII Code 02h

sending with one bit accuracy at change of second

dd.mm.yy the current date:
dd day of month (01..31)
mm month (01..12)
yy year of the century (00..99)
w the day of the week (1..7, 1 = Monday)

hh.mm.ss the current time:
hh hours (00..23)
mm minutes (00..59)
ss seconds (00..59, or 60 while leap second)

v sign of the offset of local timezone related to UTC

oo:oo offset of local timezone related to UTC in hours and minutes

ac clock status characters:
a: ‘#’ clock has not synchronized after reset
   (space, 20h) clock has synchronized after reset
  ‘ ’
c: ‘ ‘ GPS receiver has not checked its position
   (space, 20h) GPS receiver has determined its position
  ‘ ‘

d time zone indicator:
  ‘S’ CEST European Summertime, daylight saving enabled
  ‘ ’ CET European Standard Time, daylight saving disabled

f announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:
  ‘!’ announcement of start or end of daylight saving time
  ‘ ’ (space, 20h) nothing announced

  g announcement of discontinuity of time, enabled during last hour before discontinuity comes in effect:
  ‘A’ announcement of leap second insertion
  ‘ ’ (space, 20h) nothing announced

i leap second insertion
  ‘L’ leap second is actually inserted
   (active only in 60th sec.)
  ‘ ‘ (space, 20h) no leap second is inserted

bbb.bbbbn latitude of receiver position in degrees
leading signs are replaced by a space character (20h)
n latitude, the following characters are possible:
  ‘N’ north of equator
‘S’ south d. equator

longitude of receiver position in degrees
leading signs are replaced by a space character (20h)

E longitude, the following characters are possible:
‘E’ east of Greenwich
‘W’ west of Greenwich

hhhh altitude above WGS84 ellipsoid in meters
leading signs are replaced by a space character (20h)

<ETX> End-Of-Text, ASCII Code 03h
12.2.6 Format of the NMEA 0183 String (RMC)

The NMEA String is a sequence of 65 ASCII characters starting with the ‘$GPRMC’ character and ending with the characters CR (carriage return) and LF (line-feed). The format is:

$GPRMC, hhmmss.ss,A, bbbbbb, n, llllll, e, 0, 0, 0, ddmmyy, 0, 0, a*hh<CR><LF>

The letters printed in italics are replaced by ASCII numbers or letters where as the other characters are part of the time string. The groups of characters as defined below:

$ Start character, ASCII Code 24h
sending with one bit accuracy at change of second

hhmmss.ss the current time:
  hh hours (00..23)
  mm minutes (00..59)
  ss seconds (00..59, or 60 while leap second)
  ss fractions of seconds (1/10 ; 1/100)

A Status (A = time data valid)
   (V = time data not valid)

bbbb.bb latitude of receiver position in degrees
   leading signs are replaced by a space character (20h)

n latitude, the following characters are possible:
  ‘N’ north of equator
  ‘S’ south d. equator

llllll.ll longitude of receiver position in degrees
   leading signs are replaced by a space character (20h)

e longitude, the following characters are possible:
  ‘E’ east of Greenwich
  ‘W’ west of Greenwich

ddmmyy the current date:
  dd day of month (01..31)
  mm month (01..12)
  yy year of the century (00..99)

a magnetic variation

hh checksum (EXOR over all characters except ‘$’ and ‘’)

<CR> Carriage Return, ASCII Code 0Dh

<LF> Line Feed, ASCII Code 0Ah
12.2.7 Format of the NMEA 0183 String (GGA)

The NMEA (GGA) String is a sequence of characters starting with the '$GPRMC' character and ending with the characters CR (carriage return) and LF (line-feed). The format is:

```
$GPGGA,hhmss.ss,bbbbb.bbbbb,n,lllll.ll,e,A,vv,hhh,h,aaa.a,M,ggg.g,M,,0*cs
```

The letters printed in italics are replaced by ASCII numbers or letters where as the other characters are part of the time string. The groups of characters as defined below:

$ Start character, ASCII Code 24h

hhmmss.ss the current time:
- hh    hours (00..23)
- mm    minutes (00..59)
- ss    seconds (00..59, or 60 while leap second)
- ss    fractions of seconds (1/10 ; 1/100)

A Status (A = time data valid)
- (V = time data not valid)

bbbbb.bbbbb latitude of receiver position in degrees
leading signs are replaced by a space character (20h)

n latitude, the following characters are possible:
- 'N' north of equator
- 'S' south of equator

lllll.llll longitude of receiver position in degrees
leading signs are replaced by a space character (20h)

e longitude, the following characters are possible:
- 'E' east of Greenwich
- 'W' west of Greenwich

A Position fix (1 = yes, 0 = no)

vv Satellites used (0..12)

hhh.h HDOP (Horizontal Dilution of Precision)

aaa.h Mean Sea Level altitude (MSL = altitude of WGS84 - Geoid Separation)

M Units, meters (fixed value)

ggg.g Geoid Separation (altitude of WGS84 - MSL)

M Units, meters (fixed value)

cs checksum (EXOR over all characters except '$' and '"")

<CR> Carriage Return, ASCII Code 0Dh

<LF> Line Feed, ASCII Code 0Ah
12.2.8 Format of the NMEA 0183 String (ZDA)

The NMEA String is a sequence of 38 ASCII characters starting with the ‘$GPZDA’ character and ending with the characters CR (carriage return) and LF (line-feed). The format is:

$GPZDA,hhmmss.ss,dd,mm,yyyy,HH,II*cs

ZDA - Time and Date: UTC, day, month, year and local timezone.

The letters printed in italics are replaced by ASCII numbers or letters where as the other characters are part of the time string. The groups of characters as defined below:

$ Start character, ASCII Code 24h
    sending with one bit accuracy at change of second

hhmmss.ss the current UTC time:
    hh hours (00..23)
    mm minutes (00..59)
    ss seconds (00..59 or 60 while leap second)

HH,II the local timezone (offset to UTC):
    HH hours (00..+-13)
    II minutes (00..59)

dd,mm,yy the current date:
    dd day of month (01..31)
    mm month (01..12)
    yyyy year (0000..9999)

cs checksum (EXOR over all characters except ‘$’ and ‘*‘)

<CR> Carriage Return, ASCII Code 0Dh

<LF> Line Feed, ASCII Code 0Ah
12.2.9 Format of the ABB SPA Time String

The ABB SPA Time String is a sequence of 32 ASCII characters starting with the characters ">900WD" and ending with the <CR> (Carriage Return) character. The format is:

>900WD:yy-mm-tt_hh.mm;ss.fff:cc<CR>

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **yy-mm-tt** the current date:
  - **yy** year of the century (00..99)
  - **mm** month (01..12)
  - **dd** day of month (01..31)
  - _ Space (ASCII code 20h)

- **hh.mm;ss.fff** the current time:
  - **hh** hours (00..23)
  - **mm** minutes (00..59)
  - **ss** seconds (00..59, or 60 while leap second)
  - **fff** milliseconds (000..999)

- **cc** Check sum. EXCLUSIVE-OR result of the previous characters, displayed as a HEX byte (2 ASCII characters 0..9 or A..F)

- **<CR>** Carriage Return, ASCII Code 0Dh
12.2.10 Format of the Computime Time String

The Computime time string is a sequence of 24 ASCII characters starting with the T character and ending with the LF (line feed, ASCII Code 0Ah) character. The format is:

```
T:yy:mm:dd:ww:hh:mm:ss<CR><LF>
```

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **T**: Start character sending with one bit accuracy at change of second

- **yy:mm:dd**: the current date:
  - **yy**: year of the century (00..99)
  - **mm**: month (01..12)
  - **dd**: day of month (01..31)

- **ww**: the day of the week (01..07, 01 = monday)

- **hh:mm:ss**: the current time:
  - **hh**: hours (00..23)
  - **mm**: minutes (00..59)
  - **ss**: seconds (00..59, or 60 while leap second)

- **<CR>**: Carriage Return, ASCII Code 0Dh

- **<LF>**: Line Feed, ASCII Code 0Ah
### 12.2.11 Format of the RACAL standard Time String

The RACAL standard Time String is a sequence of 16 ASCII characters terminated by a X (58h) character and ending with the CR (Carriage Return, ASCII Code 0Dh) character. The format is:

\[
<X><G><U>yyyymmddhhmmss<CR>
\]

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

<table>
<thead>
<tr>
<th>(&lt;X&gt;)</th>
<th>Control character</th>
<th>code 58h</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>sending with one bit accuracy at change of second</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>(&lt;G&gt;)</th>
<th>Control character</th>
<th>code 47h</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>(&lt;U&gt;)</th>
<th>Control character</th>
<th>code 55h</th>
</tr>
</thead>
</table>

- \(yyyy\) the current date:
  - \(yy\) year of the century (00..99)
  - \(mm\) month (01..12)
  - \(dd\) day of month (01..31)

- \(hh:mm:ss\) the current time:
  - \(hh\) hours (00..23)
  - \(mm\) minutes (00..59)
  - \(ss\) seconds (00..59, or 60 while leap second)

<table>
<thead>
<tr>
<th>(&lt;CR&gt;)</th>
<th>Carriage Return, ASCII code 0Dh</th>
</tr>
</thead>
</table>

**Interface parameters:** 7 Databits, 1 Stopbit, odd. Parity, 9600 Bd
12.2.12 Format of the SYSPLEX-1 Time String

The SYSPLEX1 time string is a sequence of 16 ASCII characters starting with the SOH (Start of Header) ASCII control character and ending with the LF (line feed, ASCII Code 0Ah) character.

Please note:
To receive the Timestring on a selected terminal correctly you have to send a "C" (once, without quotation marks).

The format is:

```
<SOH>ddd:hh:mm:ssq<CR><LF>
```

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- `<SOH>` Start of Header (ASCII control character)
  - Sending with one bit accuracy at change of second

- `ddd` day of year
  - (001..366)

- `hh:mm:ss` the current time:
  - `hh` hours
    - (00..23)
  - `mm` minutes
    - (00..59)
  - `ss` seconds
    - (00..59, or 60 while leap second)

- `q` Quality indicator
  - (space) Time Sync (GPS lock)
  - (?) no Time Sync (GPS fail)

- `<CR>` Carriage-return (ASCII code 0Dh)

- `<LF>` Line-Feed (ASCII code 0Ah)
12.2.13 Format of the ION Time String

The ION time string is a sequence of 16 ASCII characters starting with the SOH (Start of Header) ASCII control character and ending with the LF (line feed, ASCII Code 0Ah) character. The format is:

\[
<\text{SOH}>\text{ddd:hh:mm:ssq}<\text{CR}><\text{LF}>
\]

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **<SOH>** Start of Header (ASCII control character) sending with one bit accuracy at change of second
- **ddd** day of year (001..366)
- **hh:mm:ss** the current time:
  - hh hours (00..23)
  - mm minutes (00..59)
  - ss seconds (00..59, or 60 while leap second)
- **q** Quality indicator:
  - (space) Time Sync (GPS lock)
  - (?) no Time Sync (GPS fail)

- **<CR>** Carriage-return (ASCII code 0Dh)
- **<LF>** Line-Feed (ASCII code 0Ah)
12.2.14 Format of the ION Blanked Time String

The ION Blanked time string is a sequence of 16 ASCII characters starting with the SOH (Start of Header) ASCII controll character and ending with the LF (line feed, ASCII Code 0Ah) character. The format is:

\[<\text{SOH}>dddd:hh:mm:ssq<CR><LF>\]

**Attention: Intervall of the String: 2min. 30 seconds every 5 minutes.**

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **<SOH>** Start of Header (ASCII control character)
  sending with one bit accuracy at change of second
- **ddd** day of year (001..366)
- **hh:mm:ss** the current time:
  - **hh** hours (00..23)
  - **mm** minutes (00..59)
  - **ss** seconds (00..59, or 60 while leap second)
- **q** Quality indicator:
  - (space) Time Sync (GPS lock)
  - (?) no Time Sync (GPS fail)
- **<CR>** Carriage-return (ASCII code 0Dh)
- **<LF>** Line-Feed (ASCII code 0Ah)
12.2.15 Format of the IRIG J Time String

The time code consists of ASCII characters, send in the format 701

- 1 start bit
- 7 data bits
- 1 parity bit (odd)
- 1 stop bit

The on-time marker is represented by the leading edge of the start bit. The time code consists of 15 characters, sent once per second at a baud rate of 300 or greater. The format is:

\(<\text{SOH}>, \text{DDD}:\text{HH}:\text{MM}:\text{SS}<\text{CR}>\text{<LF}>\)

The letters printed in italics are replaced by ASCII numbers whereas the other characters are part of the time string. The groups of characters as defined below:

- **SOH**: ASCII code „Start of Heading“ (0x01h)
- **DDD**: ordinal date, day of year (1 to 366)
- **HH, MM, SS**: time of the start bit given in hour (HH), minute (MM), second (SS)
- **CR**: ASCII code „Carriage Return“ (0x0Dh)
- **LF**: ASCII code „Line Feed“ (0x0Ah)
12.3 SyncMon Formats

SyncMon format for LANTIME firmware usage:

```
SyncMon 172.27.100.32 M3000_100_57_NTP_LAN0_test 58154 34813 2018-02-05T09:40:13 + 00:00 0.000000494 0.000041453 0.000073266 1 R -0.000011100
```

**Key-Value-Pairs**

The Format with Key-Value-Pairs can be accessed directly from a SPLUNK database server and has the following format:

```
isotime = 2018-02-05T09:40:13 + 00:00
syncmonname = SyncMon
optinterfaceip = 172.27.100.32
utcTime = 1517823613
node = M3000_100_57_NTP_LAN0_test
offset1 = 0.000000494
offset2 = 0.000041453
pathdelay = 0.000073266
status = stratum 1 / [10]
offset1min = -0.000011100
offset1max = 0.000041453
type = NTP / SW / CPU
```

**JSON**

The JSON format can be processed directly by most databases and has the following format:

```
{
  "isotime": "2018-02-05T09:40:13 + 00:00",
  "syncmonname": "SyncMon",
  "optinterfaceip": "172.27.100.32",
  "utcTime": 1517823613,
  "node": "M3000_100_57_NTP_LAN0_test",
  "offset1": 0.000000494,
  "offset2": 0.000041453,
  "pathDelay": 0.000073266,
  "status": "stratum 1 / [10]",
  "offset1Min": -0.000011100,
  "offset1Max": 0.000041453,
  "type": "NTP / SW / CPU"
}
```
12.4 Third party software

The LANTIME network timeserver is running a number of software products created and/or maintained by open source projects. A lot of people contributed to this and we explicitly want to thank everyone involved for her/his great work.

The used open source software comes with its own license which we want to mention below. If one of the licenses for a third party software product is violated, we will as soon as possible apply any changes needed in order to conform with the corresponding license after we acknowledged about that violation.

If a license for one of the software products states that we have to provide you with a copy of the source code or other material, we will gladly send it to you on data media via normal post or by e-mail upon request. Alternatively we can provide you with a link to a download location in the internet, allowing you to download the most actual version. Please note that we have to charge you for any incurred expenses if you choose to receive the source code on data media.

12.4.1 Operating System GNU/Linux

The distribution of the GNU/Linux operating system is covered by the GNU General Public License (GPL), which we included below.

More information about GNU/Linux can be found on the GNU website
www.gnu.org

and on the website of GNU/Linux
www.linux.org

12.4.2 Samba

The Samba software suite is a collection of programs, which implement the Server Message Block (SMB) protocol for UNIX systems. By using Samba your Lantime is capable of sending Windows popup messages and serves request for network time by clients using the NET TIME command.

The distribution of Samba is covered – like GNU/Linux – by the GNU General Public License, see below.

The website of the Samba project (or a mirror) can be reached at www.samba.org
12.4.3 Network Time Protocol Version 4 (NTP)

The NTP project, lead by David L. Mills, can be reached in the internet at www.ntp.org. There you will find a wealthy collection of documentation and information covering all aspects of the application of NTP for time synchronization purposes. The distribution and usage of the NTP software is allowed, as long as the following notice is included in our documentation:

***************************************************************************
* Copyright (c) David L. Mills 1992-2004
* Permission to use, copy, modify, and distribute this software
* and its documentation for any purpose and without fee is hereby
* granted, provided that the above copyright notice appears in all
* copies and that both the copyright notice and this permission
* notice appear in supporting documentation, and that the name
* University of Delaware not be used in advertising or publicity
* pertaining to distribution of the software without specific,
* written prior permission. The University of Delaware makes no
* representations about the suitability this software for any
* purpose. It is provided "as is" without express or implied
* warranty.
***************************************************************************
12.4.4 lighttpd

For our web based configuration tool (HTTP and HTTPS) we use Lighttpd. Lighttpd is a free web server, with all the essential functions of a web server. Lighttpd has been developed by the german Software Developer Jan Kneschke.

The use of this software is covered by the following license:

Copyright (c) 2004, Jan Kneschke, incremental
All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

- Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

- Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

- Neither the name of the 'incremental' nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE COPYRIGHT OWNER OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.
12.4.5 GNU General Public License (GPL)

Version 2, June 1991 - Copyright (C) 1989, 1991

Free Software Foundation, Inc.
675 Mass Ave, Cambridge, MA 02139, USA
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not
allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the
GNU General Public License is intended to guarantee your freedom to share and change free software--to make
sure the software is free for all its users. This General Public License applies to most of the Free Software
Foundation's software and to any other program whose authors commit to using it. (Some other Free Software
Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your
programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are
designed to make sure that you have the freedom to distribute copies of free software (and charge for this
service if you wish), that you receive source code or can get it if you want it, that you can change the software
or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask
you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute
copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the re-
cipients all the rights that you have. You must make sure that they, too, receive or can get the source code.
And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you
legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there
is no warranty for this free software. If the software is modified by someone else and passed on, we want its
recipients to know that what they have is not the original, so that any problems introduced by others will not
reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that
redistributors of a free program will individually obtain patent licenses, in effect making the program propri-
etary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not
licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING,
DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder
saying it may be distributed under the terms of this General Public License. The "Program", below, refers to
any such program or work, and a "work based on the Program" means either the Program or any derivative work
under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with
modifications and/or translated into another language. (Hereinafter, translation is included without limitation
in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are out-
side its scope. The act of running the Program is not restricted, and the output from the Program is covered
only if its contents constitute a work based on the Program (independent of having been made by running the
Program).
Whether that is true depends on what the Program does.
1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

   b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

   c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

   a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either
If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.
10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS
12.5 List of Literature

Kardel, Frank, "Verteilte Zeiten", ix Multiuser-Multitasking-Magazin, Heft 2/93, Verlag Heinz Heise, Hannover 1993
