Manual
Version: 1.01
2 microSync Introduction

**microSync** is a multipurpose synchronization solution with compact design and high performance. The microSync system provides multiple output signals and allows synchronization of both NTP clients and PTP slaves.

The device has four 100/1000 MBit network interfaces and can provide both, optical and electrical network connections by using SFP modules. It is possible to use different receiver variants, e.g. the 72-channel GNSS receiver for GPS, Galileo, GLONASS and BeiDou.

The sync optimized operating system supports NTP, PTP IEEE 1588 and a variety of protocols for management tasks.

**Product Highlights**

- Powerful IEEE 1588 PTP Time Server incl. IEC/IEEE 61850-9-3 & IEEE C.37.238
- High performance (S)NTP server
- Half rack solution for a space efficient design
- Different Oscillator options for advanced holdover performance
- Meinberg Device Manager for configuration and status monitoring
- Three-year manufacturer’s warranty
- Unlimited technical support including firmware updates
3  Technical Specifications microSync Chassis

Protection Rating: IP30

Operating Temperature: –20 to 55 °C (–4 to 131 °F)
   As tested per IEC 60068-2-1, Cold: –40 °C (–40 °F)
   As tested per IEC 60068-2-2, Dry Heat: 85 °C (185 °F)

Storage Temperature: –30 to 70 °C (–22 to 158 °F)

Relative Humidity: 5 to 95 % (non-condensing) at 40 °C (104 °F)

Operating Altitude: up to 4,000 m (13,123 ft) above sea level

Atmospheric Pressure: 615 to 1,600 hPa

Physical Dimensions:

[Diagram showing physical dimensions]
4 Important Safety Information

4.1 Important Safety Instructions and Protective Measures

The following safety instructions must be respected in all operating and installation phases of the device. Non-observance of safety instructions, or rather special warnings and operating instructions in product manuals, violates safety standards, manufacturer instructions and proper usage of the device. Meinberg Funkuhren shall not be responsible for any damage arising due to non-observance of these regulations.

Depending on your device or the installed options some information is not valid for your device.

If a procedure is marked with the following signal words, you may only continue, if you have understood and fulfilled all requirements. In this documentation dangers and indications are classified and illustrated as follows:

DANGER!
The signal word indicates an imminently hazardous situation with a high risk level. This notice draws attention to an operating procedure or similar proceedings, of which a non-observance may result in serious personal injury or death.

WARNING!
The signal word indicates a hazard with a medium risk gradient. This notice draws attention to an operating procedure, a procedure or the like which, if not followed, can lead to serious injuries, possibly resulting in death.

CAUTION!
The signal word indicates a hazard with a low risk gradient. This notice draws attention to an operating procedure, a procedure or the like which, if not followed, can lead to minor injuries.

ATTENTION!
This notice draws attention to an operating procedure, a procedure or the like which, if not followed, can cause damage to the product or loss of important data.
## 4.2 Used Symbols

The following symbols and pictograms are used in this manual. To illustrate the source of danger, pictograms are used, which can occur in all hazard classes.

<table>
<thead>
<tr>

*This product is handled as a B2B category product. In order to secure a WEEE compliant waste disposal it has to be returned to the manufacturer.* |
The manuals for a product are included in the scope of delivery of the device on a USB stick. The manuals can also be obtained via the Internet. Enter www.meinbergglobal.com into your browser, then enter the corresponding device name in the search field at the top.

This manual contains important safety instructions for the installation and operation of the device. Please read this manual completely before using the unit.

This device may only be used for the purpose described in this manual. In particular, the given limits of the device must be observed. The safety of the installation in which the unit is integrated is the responsibility of the installer!

Non-observance of these instructions can lead to a reduction in the safety of this device!

Please keep this manual in a safe place.

This manual is intended exclusively for electricians or persons trained by an electrician who are familiar with the applicable national standards and safety rules. Installation, commissioning and operation of this device may only be carried out by qualified personnel.
4.3 Security during Installation

**WARNING!**

Preparing for Commissioning

This built-in unit has been designed and examined according to the requirements of the standard IEC 62368-1 "Audio/video, information and communication technology equipment - Part 1: Safety requirements".

When the built-in unit is used in a terminal (e.g., housing cabinet), additional requirements according to Standard IEC 62368-1 must be observed and complied with. In particular, the general requirements and the safety of electrical equipment (such as IEC, VDE, DIN, ANSI) as well as the applicable national standards are to be observed.

The device has been developed for use in the industrial sector as well as in residential areas and can only be used in such environments. For environments with higher levels of soiling, additional measures, e.g., installation in an air-conditioned control cabinet required.

Transport, Unpacking, Installation

If the unit is brought into the operating room from a cold environment, condensation may occur, wait until the unit is temperature-controlled and absolutely dry before operating it.

When unpacking, setting up, and before operating the equipment, be sure to read the information on the hardware installation and the specifications of the equipment. These include, for example, dimensions, electrical characteristics, and necessary ambient and climatic conditions, etc.

The fire protection must be ensured in the installed state.

For mounting, the housing must not be damaged. No holes may be drilled in the housing.

For safety reasons, the device with the highest mass should be installed in the lowest position of the rack. Other devices must be placed from the bottom to the top.

The device must be protected against mechanical stress such as vibration or shock.
Connecting Data Cables
During a thunderstorm, data transmission lines must not be connected or disconnected (risk of lightning).

When wiring the devices, the cables must be connected or disconnected in the order of the arrangement described in the user documentation accompanying the device. Always attach all cables to the plug during connection and removal. Never pull the cable itself. Pulling the cable can cause the cables to disconnect from the plug.

Install the cables in way that they do not constitute a hazard (danger of tripping) and are not damaged, i.e. kinked.

Connecting Power Supply
This equipment is operated at a hazardous voltage. Non-observance of the safety instructions in this manual may result in serious personal injury or property damage.

Before connecting to the power supply, a grounding cable must be connected to the earth connection of the device.

Before operation, check that all cables and lines work properly and are undamaged. Pay particular attention to the facts that the cables do not have kinks or that they are not too short around corners, and no objects are placed on the cables. Also make sure that all connections are secure.

Faulty shielding or cabling will endanger your health (electrical shock) and may destroy other equipment.

Ensure that all necessary safety precautions have been taken. Make all connections to a unit before turning on the power. Observe the safety instructions on the device (see safety symbols).

The metal housing of the device is grounded. It must be ensured that enough air and creepage distances to neighboring voltage-carrying parts are provided during assembly in the control cabinet and no short circuits are caused.

In the case of malfunctions or servicing (e.g. in the event of a damaged housing or power cable or when fluids or foreign objects enter), the current flow can be interrupted. Questions about the house installation, need to be clarified with your house administration.

The power supply should be connected with a short, low-inductance line.

DC Power Supply
Outside the assembly group the device must be disconnectable from the power supply in accordance with the provisions of IEC 62368-1 (e.g. by the primary line protection).

Installation and disassembly of the power supply plug is only permitted if the assembly group is switched off (e.g. by the primary line protection).

The supply lines must be adequately secured and dimensioned.

Connection Cross Section: 1 mm² – 2.5 mm² 17 AWG – 13 AWG

The device must be supplied with a suitable disconnector (switch). The separation device must be easily accessible, placed near the device and marked as a separation device for the unit.
4.4 Protective Conductor- / Ground-Terminal

ATTENTION!

In order to ensure safe operation and to meet the requirements of IEC 62368-1, the device must be correctly connected to the protective earth conductor via the protective earth connection terminal.

If an external earth connection is provided on the housing, it must be connected to the equipotential bonding rail (grounding rail). The mounting parts (without cable) are not included in the scope of delivery.

Note:
Please use a grounding cable $\geq 1.5 \text{ mm}^2$
Always pay attention to a correct crimp connection!

4.5 Safety during Operation

WARNING!

Avoiding Short-Circuits
Make sure not to get any objects or liquids inside the unit. Electric shock or short circuit could result.

Ventilation Slots
Make sure that the ventilation slots are not covered or dusty, as there is a danger of overheating during operation. Disturbances during operation can result.

Normal Operation
The normal operation and the observance of the EMC limits (electromagnetic compatibility) are only ensured if the housing cover is properly installed and when the doors are closed (cooling, fire protection, shielding against electrical, magnetic and electromagnetic fields).

Switch off in fault / service case
By switching off, the devices are not disconnected from the power supply. In the event of a fault or service case, the devices must be immediately disconnected from all power supplies.

Follow the steps below:
- Switch off the device
- Disconnect all power plugs
- Inform the service
- Devices that are connected via one or more uninterruptible power supplies (UPS) remain operational even when the UPS power cord is disconnected. Therefore, you must put the UPS out of operation according to the documentation of the corresponding user documentation.
4.6 Safety during Maintenance

**WARNING!**

When you are expanding the device, use only device parts that are approved for the system. Non-observance may result in injury to the EMC or safety standards and cause malfunction of the device.

If device parts, which are released for the system, are extended or removed there may be a risk of injury in the area of the hands, due to the pull-out forces (approx. 60 N).

The service informs you which device parts may be installed.

The device must not be opened, repairs to the device may only be carried out by the manufacturer or by authorized personnel. Improper repairs can result in considerable danger to the user (electric shock, fire hazard).

Unauthorized opening of the device or of individual parts of the device can also lead to considerable risks for the user and result in a loss of warranty as well as an exclusion of liability.

- Danger due to moving parts – keep away from moving parts.

- Device parts can become very hot during operation. Do not touch these surfaces! If necessary, switch off the unit before installing or removing any equipment, and allow it to cool down.

4.7 Handling Batteries

**CAUTION!**

The lithium battery on the receiver modules has a service life of at least 10 years. If an exchange is necessary, the following notes must be observed:

The device is equipped with a lithium battery. The battery must not be short-circuited or recharged. Replacement of the lithium battery may only be carried out by the manufacturer or authorized personnel.

Risk of explosion if the battery is not replaced correctly. Replace only with the same or equivalent type recommended by the manufacturer.

When disposing used batteries, observe the local regulations for the disposal of hazardous waste.
4.8 Cleaning and Care

ATTENTION!

Do not wet clean the appliance! Penetrating water can cause considerable dangers to the user (e.g., electric shock).

Liquid can destroy the electronics of the device! Liquid penetrates into the housing of the device and can cause a short circuit of the electronics.

Only clean with a soft, dry cloth. Never use solvents or cleaners.

4.9 Prevention of ESD Damage

ATTENTION!

The designation ESD (Electrostatic Sensitive Devices) refers to measures which are used to protect electrostatically endangered components from electrostatic discharge and thus to prevent destruction. Systems and assemblies with electrostatically endangered components usually have the following characteristics:

Indicator for assemblies with electrostatic endangered components

The following measures protect electrostatically endangered components from destruction:

Prepare removal and installation of assemblies
Unload yourself (for example, by touching a grounded object) before touching assemblies.

Ensure that you wear a grounding strap on the wrist when working with such assemblies, which you attach to an unpainted, non-conductive metal part of the system.

Use only tools and devices that are free from static electricity.

Transferring Assemblies
Assemblies may only be touched at the edge. Do not touch any pins or conductors on assemblies.

Installing and Removing Assemblies
Do not touch persons who are not grounded while removing or installing components. This could result in a loss of grounding protection from your electrostatic discharge.

Storing Assemblies
Always keep assemblies in ESD protective covers. These protective covers must be undamaged. ESD protective covers, which are extremely wrinkled or even have holes, no longer protect against electrostatic discharge.

ESD protective covers must not be low-resistance and metallically conductive if a lithium battery is installed on the assembly.
4.10 Return of Electrical and Electronic Equipment

ATTENTION!

WEEE Directive on Waste Electrical and Electronic Equipment 2012/19 / EU
(WEEE Waste Electrical and Electronic Equipment)

Separate Collection
Product Category: According to the device types listed in the WEEE Directive, Appendix 1,
this product is classified as an IT and communication device.

This product meets the labeling requirements of the WEEE Directive. The product symbol on
the left indicates that this electronic product must not be disposed of in domestic waste.

Return and Collection Systems
For returning your old equipment, please use the country-specific return and collection systems
available to you or contact Meinberg.

The withdrawal may be refused in the case of waste equipment which presents a risk to
human health or safety due to contamination during use.

Return of used Batteries
Batteries marked with one of the following symbols may not be disposed of together with the
household waste according to the EU Directive.
5 microSync - Connectors

5.1 GNSS Antenna

**Type of receiver:** GNS/GPS/Galileo/BeiDou
Number of channels: 72

**Type of antenna:** 40 dB Multi GNSS L1
Antenna with Integrated Lightning Protection

Frequency band: L1, E1
Gain: $\geq 3.5 \text{ dBic} / \geq 3 \text{ dBic}$
Nominal Impedance: 50 ohms

**Cable:** shielded coaxial line

**Cable length:** max. 70m with Belden H155 coax cable

**Connector:** SMA female

**WARNING!**
Working on the antenna system during thunderstorms

**Danger to life due to electrical shock!**
- Do not carry out any work on the antenna system or the antenna cable if there is a risk of a lightning strike.
- Do not carry out any work on the antenna system if the safety distance to free lines and sequential circuits is exceeded.
5.2 Programmable pulse output

  - **Pin 3**: TxD (transmit)
  - **Pin 5**: GND (ground)
- **Connector**: 9pin D-SUB male
- **Cable**: data cable (shielded)
  - PC connector 1:1
5.6 Status Indicators

CPU:

R (Receiver)
green: the reference clock (e.g. build-in GNS) provides a valid time
red: the reference clock does not provide a valid time

T (Time Service)
green: NTP is synchronized to the reference clock, e.g. GNS
red: NTP is not synchronized or switched to the "local clock"

N (Network)
green: all monitored network interfaces are connected ("Link up")
red: at least one of the monitored network interfaces is faulty

A (Alarm)
off: no error
red: general error

REC:

Fail
red: no synchronization

Ant
red: no synchronization resp. no antenna connected or short circuit on the antenna line
green: antenna connected and clock is synchronized

Nav
green: positioning complete

Init
blue: initialisation phase

green: "warmed up" - oscillator is adjusted

**Scheme Terminal assignment**

**Programmable Pulses**

Four programmable outputs (PP 1 - PP 4)
DC-insulated by optocouplers

\[ U_{CE_{max}} = 55 \text{ V} \]
\[ I_{C_{max}} = 50 \text{ mA} \]
\[ P_{tot} = 150 \text{ mW} \]

**Response time**

Turn on Time: typ. 5\(\mu\)s, max. 9\(\mu\)s
Turn off Time: typ. 10\(\mu\)s, max. 70\(\mu\)s

**Error Relay**

The X1 connector has a potential-free contact which is controlled directly by the used reference clock (GPS, GNS, GNS-UC). Normally, when the reference clock has synchronized, the relay contact "NO" switches to active. If the reception is disturbed or the device is switched off, the relay contact "NC" is active.

**Technical Specification**

**Switching Voltage max:** 60 V DC

**Switching Current max:** \( I_{max} : 400 \text{mA} \)

**Switching Load max:** 24 W

**Response Time:** ca.2ms
6 GNSS Satellite Navigation

The satellite receiver clock GNS has been designed to provide extremely precise time to its user. The clock has been developed for applications where conventional radio controlled clocks can’t meet the growing requirements in precision. High precision available 24 hours a day around the whole world is the main feature of the new system which receives its information from the satellites of the Russian GLONASS (GLObal NAvigation Satellite System) and the American GPS (Global Positioning System).

GPS and GLONASS are satellite-based radio-positioning, navigation, and time-transfer systems. They are based on accurately measuring the propagation time of signals transmitted from satellites to the user’s receiver. A fully operational constellation of more than 24 satellites together with several active spares in six (GPS) respectively three (GLONASS) orbital planes in 20183 km (GPS) respectively 19100 km (GLONASS) over ground provides a minimum of four satellites to be in view 24 hours a day at every point of the globe. Four satellites need to be received simultaneously if both receiver position (x, y, z) and receiver clock offset from GPS/GLONASS system time must be computed. All the satellites are monitored by control stations which determine the exact orbit parameters as well as the clock offset of the satellites’ on-board atomic clocks. These parameters are uploaded to the satellites and become part of a navigation message which is retransmitted by the satellites in order to pass that information to the user’s receiver.

The high precision orbit parameters of a satellite are called ephemeris parameters whereas a reduced precision subset of the ephemeris parameters is called a satellite’s almanac. While ephemeris parameters must be evaluated to compute the receiver’s position and clock offset, almanac parameters are used to check which satellites are in view from a given receiver position at a given time. Each satellite transmits its own set of ephemeris parameters and almanac parameters of all existing satellites.

GPS was installed by the United States Department of Defense and provides two levels of accuracy: The Standard Positioning Service (SPS) and the Precise Positioning Service (PPS). While PPS is encrypted and only available for authorized (military) users, SPS has been made available to the general public.

GLONASS was developed to provide real-time position and velocity determination, initially for use by the Soviet military in navigating and ballistic missile targeting. Also GLONASS satellites transmit two types of signals: a Standard Precision (SP) signal and an obfuscated High Precision (HP) signal.

The BeiDou Navigation Satellite System (BDS) is a Chinese satellite navigation system. The second generation of the system, officially called the BeiDou Navigation Satellite System (BDS) and also known as COMPASS or BeiDou-2, will be a global satellite navigation system consisting of 35 satellites, and is under construction as of January 2015. It became operational in China in December 2011, with 10 satellites in use, and began offering services to customers in the Asia-Pacific region in December 2012. It is planned to begin serving global customers upon its completion in 2020.

Galileo is the global navigation satellite system (GNSS) that is currently being created by the European Union (EU) through the European Space Agency (ESA) and the European GNSS Agency (GSA). The use of basic Galileo services will be free and open to everyone.

The complete 30-satellite Galileo system (24 operational and 6 active spares) is expected by 2020. At an altitude of 23,222 km above the Earth’s surface, the satellites require about 14 hours for one orbit.
6.1 Time Zone and Daylight Saving

GPS system time differs from the universal time scale (UTC) by the number of leap seconds which have been inserted into the UTC time scale since GPS was initiated in 1980. The current number of leap seconds is part of the navigation message supplied by the satellites, so the internal real time of the GNS is based on UTC time scale. Conversion to local time and annual daylight saving time can be done by the receiver’s microprocessor if the corresponding parameters are set up by the user.
7 40dB Multi GNSS L1 Timing Antenna with Integrated Lightning Protection

The GPS, GLONASS, Galileo and BeiDou satellites are not stationary but circle round the globe in a period of about 12 hours. They can only be received if no building is in the line-of-sight from the antenna to the satellite, so the antenna unit must be installed in a location with a free view to the sky. The best reception is given when the antenna has a free view of 8° angular elevation above horizon. If this is not possible the antenna should be installed with a mostly free view to the equator because of the satellite courses which are located between latitudes of 55° North and 55° South. If even this is not possible problems occur especially when at least four satellites for positioning have to be found.

The active L1 timing reference antenna is specifically designed for long-lasting, trouble-free deployments for a variety of applications. The low noise, high gain amplifier is well suited to address attenuation issues. The proprietary quadrifiliar helix design, coupled with multistage filtering provides superior out-of-band rejection and lower elevation pattern performance than traditional patch antennas.

- Their unique radome shape sheds water and ice, while eliminating problems associated with bird perching.
- This antenna is made of materials that fully comply with provisions stipulated by EU directives RoHS 2002/95/EC.
- The antenna provides integrated lightning protection capability.
- The antenna also features ESD, reverse polarity protection and transit voltage suppression.

A standard coaxial cable with 50 ohm impedance should be used to connect the antenna to the receiver. The max. length of cable between antenna and receiver is 50 meters (H155 - Low-Loss).

See data sheet "40 dB Multi GNSS Timing Antenna with Integrated Lightning Protection" (pctel_gpsl1gl.pdf) or download this document:

Active Multi GNSS Antenna
http://www.meinbergglobal.com/download/docs/other/pctel_gpsl1gl.pdf
7.1 GNSS Antenna for Stationary Installation

The Multi GNSS Antenna is an active GNSS antenna which can receive the signals of the GPS, GLONASS, Galileo and Beidou satellite systems. It is very well suited for stationary installations, operates with a 5V DC supply voltage provided by the receiver, and has an integrated surge protection.

The antenna cable length can be up to 70 meters if a H155 low-loss coaxial cable is used.

Mounting and Installation of the GNSS/L1 Antenna

![Multi GNSS Antenna diagram]

**Figure: Schematic diagram of mounting the Multi GNSS Antenna**

**WARNING!**
Antenna mounting without effective anti-fall protection

Danger to life due to fall!
- Pay attention to effective working safety when installing antennas!
- **Never** work without an effective anti-fall equipment!

**WARNING!**
Working on the antenna system during thunderstorms

Danger to life due to electrical shock!
- Do **not** carry out any work on the antenna system or the antenna cable if there is a risk of a lightning strike.
- Do **not** carry out any work on the antenna system if the safety distance to free lines and sequential circuits is exceeded.
8 Starting of Operation

Meinberg Device Manager
The Meinberg Device Manager software is a graphical desktop application that allows to configure Meinberg modules and assembly groups over an encrypted network connection or a local USB or serial connection. A great advantage of the Meinberg Device Manager is that various modules/assembly groups can be configured and monitored simultaneously. The Meinberg Device Manager for Windows can be used under Windows 7 and all newer versions. Supported Linux distributions include Ubuntu, Mint Linux, Debian, SUSE Linux, CentOS, and others.

The software is delivered on the USB stick included in the scope of delivery and does not need to be installed or copied on the PC. The Meinberg Device Manager can be started directly from the USB data carrier. The computer must be connected to the network in which the microSync system is connected.

The software is downloadable free of charge from our homepage:

Please Note:
You can download a complete and detailed manual about the Meinberg monitoring software on our homepage:
8.1 Establishing a Network Connection

1. click on “Add Device”.
2. select the connection type Network.
3. Enter the IPv4 address of the system to be connected to.

Parameter

- **Authentication:** the Username & Password option is only supported for modules with MeinbergOS.
- **Username (Optional):** enter the user name with which the Meinberg Device Manager should authenticate itself to your Meinberg system.
- **Password:** enter a password with which Meinberg Device Manager should authenticate itself to your Meinberg system.
- **Silent Login:** you have the possibility that the Meinberg Device Manager will not ask for your username and password every time you log in.

Changing your Network Password

To change the password for the currently logged in user, click this icon.
Host Key Verification
To enable a secure connection to the system via SSH, you must add the key used to your known hosts. This ensures that this device can be permanently identified as a trusted communication partner.

To confirm, click on Yes.

8.1.1 Connecting with the Network Configuration Wizard

The "Network Configuration Wizard" allows you to connect to your microSync system.

Start the Network Configuration Wizard
You will find the wizard in the Section 4 of the start screen on the bottom right. This opens by clicking on the button. The configuration is explained step by step.

MAC Address
Enter the 12-digit MAC address located on your Meinberg module. Then confirm the entry with "Next" to continue.

Hostname
Enter any host name for your system or leave the field blank. Then confirm the entry with Next to continue.

Static IP or DHCP
In the next step you can determine whether you want to enter the IP address manually or whether a DHCP server should assign the IP address automatically.

Static IP
Enter the IP address, netmask, gateway and DNS server into the fields. Then confirm with Next to continue.

DHCP Client
The DHCP client is activated. Click Next to continue.

When assigning the IP address via the wizard, the following must be observed:

- PC and the corresponding system must be physically connected in the same network.
- IP configuration via a gateway/router is not possible.
- A forwarding of broadcast packets in the network is usually blocked or not allowed.
9 Technical Appendix

9.1 Technical Specifications GNS Receiver

Type of receiver: GPS/GLONASS/Galileo/BeiDou receiver
Number of channels: 72
Frequency band: GNSS L1
  GPS: 1575.42 ±10 MHz
  GLONASS: 1602-1615 MHz
  Galileo: 1542.5 MHz
  BeiDou: 1561.09 MHz

Antenna: Combined GPS/GLONASS antenna
  3dB Bandwidth: 1590 ±30 MHz
  Impedance: 50 Ω
  Gain: 40 ±4 dB
  Supply Voltage: 5 V
  Cable: max. 70m low-loss cable (Belden H155)
  Connector: SMA female

Power Supply
for Antenna: 5 V, 100 mA - continuous short circuit protection, automatic recovery
  power supply via antenna cable

Time to Synchronization:
one minute with known receiver position and valid almanac
12 minutes if invalid battery buffered memory

Pulse Outputs:
eight programmable outputs (PP 1 - PP 8)
DC-insulated by optocouplers
  U_{CE\text{max}} = 55 V, I_{C\text{max}} = 50 mA, P_{tot} = 150 mW, V_{iso} = 5000 V
  pulse delay: t_{on} e.g. 20 μsec (I_{C} = 10mA)
  t_{off} e.g. 3 μsec (I_{C} = 10mA)

change of second (P_SEC, TTL level)
change of minute (P_MIN, TTL level)

Accuracy of Pulses:
after synchronization and 20 minutes of operation
  OCXO SQ/MQ/HQ/DHQ: better than ±50 nsec
  better than ±2 μsec during the first 20 minutes of operation

Frequency Outputs:
  10 MHz, TTL level into 50 Ohm
  1 MHz, TTL level
  100 kHz, TTL level

Frequency Synthesizer:
1/8 Hz up to 10 MHz

Accuracy of Synthesizer:
base accuracy depends on system accuracy
  1/8 Hz to 10 kHz Phase syncron with pulse output P_SEC
  10 kHz to 10 MHz frequency deviation < 0.0047 Hz
Synthesizer Outputs:

- **F_SYNTH**: TTL level
- **F_SYNTH_OD**: open drain
  - Drain voltage: < 100 V
  - Sink current to GND: < 100 mA
  - Dissipation power at 25 °C: 360 mW
- **F_SYNTH_SIN**: sine-wave
  - Output voltage: 1.5 V eff.
  - Output impedance: 200 Ohm

Serial Ports:

- Asynchronous serial port RS-232
  - Baud Rate: 300, 600, 1200, 2400, 4800, 9600, 19200 Baud
  - Framing: 7E1, 7E2, 7N2, 7O1, 7O2, 8E1, 8N1, 8N2, 8O1
  - Default setting:
    - COM 0: 19200, 8N1
    - Meinberg Standard time string, per second

Time Code Outputs:

- Unbalanced modulated sine wave signal:
  - 3 Vpp (MARK), 1 Vpp (SPACE) into 50 Ohm

- DCLS-signal: TTL into 50 ohm, active-high or -low

10 WEEE Compliance

Compliance with EU Directive 2011/65/EC (RoHS)

We hereby declare that this product is conform to the European Directive 2011/65/EC, "Restrictions of Hazardous Substances in Electrical and Electronic Equipment". We ensure that electrical and electronic products sold in the EU do not contain lead, cadmium, mercury, hexavalent chromium, polybrominated biphenyls (PBBs), and polybrominated diphenyl ethers (PBDEs) above the legal threshold.

WEEE status of the product

This product is handled as a B2B (Business to Business) category product. In order to secure a WEEE compliant waste disposal it has to be returned to the manufacturer. Any transportation expenses for returning this product (at its end of life) have to be incurred by the end user, whereas Meinberg will bear the costs for the waste disposal itself.
